Executive Summary

EXECUTIVE SUMMARY

The Michigan Airport System Plan (MASP 2000) documents the planning process that identifies the aviation role of public use airports in Michigan through the year 2020.

MASP 2000 presents the results of a system planning process that has been aligned with the goals and objectives of MDOT's State Long Range Plan. The *MASP 2000* supports programming decisions and is useful in evaluating programming actions related to airport system and airport facility deficiencies.

A diverse group of individuals was assembled into a *MASP 2000* Steering Committee that provided valuable input and direction over the course of the study. This broad based group included representatives from both within and outside of the aviation community.

There are 236 public use airports in Michigan in 1999. Of this total, 129 or 55 percent are publicly owned, with 107 or 45 percent privately owned. Each airport has been assigned to its appropriate airport classification based on primary runway length and width, and other airport features. Forty-one airports are currently assigned to the "C" or "D" Approach Category meaning that they can accommodate business jet aircraft. An additional 86 airports, designated in Approach Category "B", have paved runways under 5,000 feet in length and can accommodate twin engine or smaller aircraft. The remaining 107 airports, Approach Category "A" facilities, have turf runways and, generally, are limited to use by single engine aircraft.

Between 1998 and 2020 based aircraft are projected to grow by 7

percent from 6,914 to 7,397. During this same period total aircraft operations will grow by 29 percent from 4.4 million to 5.6 million.

Among the key functions of the *MASP 2000* is, from a state perspective, identifying those airports that can best respond to state goals and objectives. To this end, all airports, following a rigorous analytical process, were assigned to one of three tiers based on their contribution to state goals. Tier 1 airports respond to critical/essential state airport system goals. These airports should be developed to their full and appropriate level. Tier 2 airports complement the essential/critical state airport system and/or respond to local community needs. Focus at these airports should be on maintaining infrastructure with a lesser emphasis on facility expansion. Tier 3 airports duplicate services provided by other airports and/or respond to specific needs of individuals and/or small businesses.

A series of system goals were identified as an outcome of an issue identification process related to the *State Long Range Plan*. The system goals identified were...

- Airports should serve significant population centers
- Airports should serve significant business centers
- Airports should serve significant tourism/convention centers
- Airports should provide access to the general population
- Airports should provide adequate land area coverage
- Airports should provide adequate regional capacity, and
- Airports should serve seasonally isolated areas.

Each of these system goals was subjected to a rigorous analytical process that resulted in the establishment of system standards and the designation of airports for inclusion in either Tier 1 or Tier 2. Airports not designated to either Tier 1 or Tier 2 were assigned, by default, to Tier 3.

The following table summarizes the system standards and indicated the number of airports included in Tier 1 and Tier 2 for each system goal. A number of airports respond to more than one system goal.

| Composite Alternative Summary | | | | | |
|--------------------------------------|-----------|--------------|--------------|--------|--------|
| System Goal | Apt Class | Service Area | Service Goal | Tier 1 | Tier 2 |
| Population Centers | C-II | 30 min | 95% | 32 | 10 |
| Business Centers | C-II | 30 min | 95% | 35 | 15 |
| Tourism Centers | B-II | 30 min | 95% | 39 | 10 |
| General Population Access | B-II | 45 min | 95% | 28 | 4 |
| Land Area Coverage | B-I | 30 miles | 95% | 50 | 0 |
| Regional Capacity | B-I | na | 125% | 65 | 16 |
| Isolation | B-I | na | 100% | 7 | 0 |
| Overall | | | | 88 | 25 |

In addition to establishing system goals, a series of facility goals were developed that identify the basic components of an airport. These facility goals are specific for each airport classification. Facility goals are...

- Primary runway system
- Pavement condition
- All weather access
- Year round access
- Basic pilot and aircraft services
- Airport zoning
- Navigational aids
- Instrument approaches
- Surface Access

All airports were evaluated to determine whether they currently meet each facility standard, and the extent and cost associated with responding to deficiencies through the year 2020. The following table identifies the number of Tier 1 airports meeting the facility standards.

| Number of Airports Meeting Facility Goal Standards | | | | | | | |
|--|--------------------|------------------|-----------------|--------------------|------------|-------------------|-----------|
| Facility Goal | System Goal | | | | | | |
| | Population Centers | Business Centers | Tourism Centers | General Population | Land Cover | Regional Capacity | Isolation |
| Number of Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Primary Runway System | 29 | 25 | 29 | 27 | 42 | 49 | 2 |
| Pavement Condition | 21 | 21 | 22 | 15 | 27 | 36 | 2 |
| All Weather Access | 15 | 13 | 16 | 16 | 20 | 21 | 0 |
| Year Round Access | 32 | 35 | 37 | 28 | 47 | 65 | 3 |
| Basic Pilot & Aircraft Serv | 29 | 32 | 28 | 24 | 39 | 63 | 1 |
| Airport Zoning | 18 | 18 | 18 | 16 | 23 | 24 | 0 |
| Navigational Aids | 23 | 23 | 22 | 20 | 32 | 39 | 2 |
| Instrument Approaches | 25 | 20 | 36 | 28 | 41 | 65 | 5 |
| Surface Access | 10 | 12 | 22 | 25 | 42 | 57 | 2 |

The cost associated with retiring system deficiencies is \$115 million per year. Of this total; \$78 million are for deficiencies at air carrier airports; \$30 million for Tier 1 general aviation airports; \$6 million for Tier 2 airports; and \$1 million for Tier 3 airports.

Current funding levels for capital improvements, including federal, state and local resources, total approximately \$70 million. Of this total, \$55 million are spent at air carrier airports. The remaining \$15 million are spent at general aviation airports.

An aviation investment strategy will be developed subsequent to the *MASP 2000* to help determine project selection priorities.

STUDY TEAM

The conduct of the *Michigan Airport System Plan* was undertaken under the direction of a multi level team whose support, guidance, and sustained high quality efforts made development of the *MASP 2000* possible.

Co-sponsors of the *MASP 2000* study effort include MDOT's Chief Administrative Officer, Greg Rosine; the Deputy Director for the Bureau of Aeronautics, Bill Gehman; the Deputy Director for the Bureau of Transportation Planning, Lou Lambert; and the Assistant Deputy Director of the Bureau of Transportation Planning, Susan Mortel.

A diverse and dedicated group of individuals representing a wide variety of organizations both within and outside of the aviation community was assembled into a *MASP 2000* Steering Committee that provided valuable input and direction over the course of the study. Members of the *MASP 2000* Steering Committee included....

- ☐ Bridgitt Hewitt representing the Southeast Michigan Council of Governments
- ☐ Sue Higgins representing the Michigan 3C Directors
- ☐ Mark Johnson representing the Michigan Association of Airport Executives
- ☐ Lowell Kraft representing the Michigan Aeronautics Commission
- ☐ Jim Opatrny representing the Federal Aviation Administration
- ☐ Matt Skeel representing the Michigan 3C Directors
- ☐ Jim Stingle representing the Michigan Association of Regions
- ☐ Jon Stout representing the Michigan Association of Airport Executives
- ☐ Cody Welch representing the Michigan Aeronautics Commission General Aviation Committee

The third component to the timely and creative development of the

MASP 2000 was the MDOT study team. This group of diverse and talented professionals assembled from the Bureau of Transportation Planning and the Bureau of Aeronautics made the entire effort possible. These individuals include...

...from the Bureau of Aeronautics: Carol Aldrich, Dave Baker, Matt Brinker, Jim Downer, Rick Hammond, Alan Kalis, Pauline Misjak, Mark Noel, John Pierce, Steve Schultz, Ralph Sims, Linn Smith, Mary Kay Trierweiler, and Juan Zapata

...from the Bureau of Transportation Planning: Garth Banninga, Jim Brush, Dave Eggert, Sean Gambrel, Terry Gotts, Cory Johnson, Todd Kauffman, Dave Kiter, Bob Kuehne, Marty Lontz, Paul Lott, Scott Maier, Dick Nellett, and Jacob Tiedt

It is with heartfelt thanks that we acknowledge all of the team members for their contributions to the development of the ***Michigan Airport System Plan***.

Oliver House, AERO
Steve Vertalka, BTP
Co-Project Managers

Introduction

INTRODUCTION

State airport system planning is a process which results in the documentation of airport related facilities necessary to meet current and future air transportation needs of the state. The plan identifies the aeronautical role of existing and recommended new airports. It also describes the development necessary at each, and estimated system costs. State system planning is accomplished within a comprehensive planning framework, consistent with state goals and objectives for economic development and transportation. It provides direction for airport master planning. It also serves as an important component of the Federal Aviation Administration (FAA) National Plan of Integrated Airport Systems (NPIAS).

The purpose of airport system planning, described in its broadest sense, is to determine the extent, type, nature, location, and timing of airport development needed in the state to establish a viable, balanced, and integrated system of airports to provide adequate service to Michigan businesses and residents. The Michigan Airport System Plan (*MASP 2000*) includes the following features...

Goals and measurable objectives with respect to airport development and the relationship to Michigan's economic development and transportation infrastructure.

Aviation oriented objectives regarding the safety and level of service of Michigan's airports.

Policy and technical direction for airport master planning to be undertaken by individual airport sponsors.

Provision of a management and coordinative resource to complement and support urban and regional planning.

Support for a continuing airport planning presence, to be drawn on as the need arises, and to assure that planning issues are continually and effectively addressed and that the state plan is a current document.

Michigan has a continuing obligation with the Federal Aviation Administration (FAA) to develop and maintain a current state system plan. This document, *MASP 2000*, presents the results of this system planning process and has been aligned with the goals and objectives of MDOT's State Long-Range Plan. The *MASP 2000* supports programming decisions and is useful in evaluating programming actions related to airport system and airport facility deficiencies.

The Michigan Airport System Plan is contained in a two set volume. This document, the MASP 2000 Report, comprises the first volume and provides a summary of the MASP methodology and findings. Volume II is a technical supplement which provides a detailed description of methodology, historic data, and selection criteria that was used in the formulation of the plan.

System Description

SYSTEM DESCRIPTION

There are three areas which will be examined in regard to the description of the airport system in Michigan. These are...

- ☐ Number and Location of Existing Airport Facilities
- ☐ Airport Classifications
- ☐ Airport Service Areas

Number and Location of Existing Airport Facilities

There are 236 public use airport facilities throughout Michigan in 1999. Not included in the *MASP 2000* are private use airfields, seaplane bases, heliports, and military facilities, although joint use public/military facilities are included in the system plan. Of the 236 public use airports, 129 or 54.7 percent are publicly owned with the balance, 107 or 45.3 percent privately owned. Although both types of facilities are open to the public, ownership plays an important role in at least two ways. First, publicly owned airports tend to continue functioning as airports over the long haul with a sense of stability that is important to users of the airports. They are more readily accepted as a community asset. Privately owned airports are far more likely to drift into and out of public use and consequently are less reliable as a long term transportation resource. Additionally, privately owned airports are often under extreme pressure from developers and others for conversion into non aviation uses such as housing or commercial developments. Once converted to another use, the likelihood of replacing one airport with another is remote at best.

Table 1 identifies the number of public use airports in each county by ownership in 1999. Two counties, Baraga and Keweenaw, both located in the upper peninsula, are without public use airports. One

additional county, Missaukee, does not have a public owned airport. Clinton county, with twelve, has more public use airports than any other county.

Airport Classifications

Airports are classified based on the operating and physical characteristics of the aircraft using the airport. The FAA uses an Airport Reference Code (ARC) system that classifies airports by the operational and physical characteristics of the most demanding aircraft intended to operate at the facility. This system has two components -- *approach category* which relates to the operational characteristics of aircraft and *design group* which relates to the physical characteristics of aircraft.

Approach Category

An aircraft approach category is a grouping of aircraft based on 1.3 times their stall speed in their landing configuration at their maximum certified landing weight. This aircraft group must generate or be forecasted to generate at least 500 total annual operations. The highest category of aircraft to meet this standard is established as the critical aircraft at that airport.

| Table 2 | |
|------------------------------------|-----------------------|
| Approach Category Standards | |
| FAA Approach Category | Approach Speed |
| A | less than 91 knots |
| B | 91 to 120 knots |
| C | 121 to 140 knots |
| D | 141 to 165 knots |
| E | 166 knots or more |

Design Group

Airplane design group is a grouping of airplanes based on wingspan of an airport's critical aircraft. This, in turn, determines the geometrics at an airport. Runway and taxiway widths, apron sizes, turning radii, and other airport physical characteristics are based on design group designation.

Table 3
Design Group Standards

| FAA Design Group | Wingspan |
|------------------|----------------------|
| I | less than 49 feet |
| II | 49 to 78 feet |
| III | 79 to 117 feet |
| IV | 118 to 170 feet |
| V | 171 feet to 213 feet |
| VI | 214 feet to 261 feet |

FAA Common Airport Classification

Airports are commonly classified as utility or transport. The utility category is further subdivided into four categories.

Basic Utility -- Stage I These airports serve approximately 75 percent of the single-engine airplanes used for personal and business purposes. Precision or non-precision Instrument Flight Rules (IFR) approach operations are not usually anticipated. This airport would have an ARC of A-I. In Michigan this category would include all airports with only turf runways.

Basic Utility -- Stage II These airports serve all airplanes of stage I plus high performance single engine aircraft and light twin engine aircraft typically used for business and air-taxi purposes. Precision approach operations are not usually anticipated. This airport would have an ARC of B-I. In Michigan this category would include airports with a paved primary runway up to 3,500 feet in length.

General Utility -- Stage I These airports serve all small airplanes. Non-precision approach operations are usually anticipated. This airport would have an ARC of B-II. In Michigan this category would typically include airports with primary runways between 3,500 and 4,300 feet in length.

General Utility -- Stage II These airports serve large airplanes in approach category C and usually have the capability for precision approach operations. This airport would have an ARC of C-II. In Michigan this category would

typically include airports with primary runways up to 5,000 feet in length.

Transport These airports serve airplanes in approach category C and D. Precision operations could be accommodated at this type of airport. This airport would have an ARC of C-III, C-IV, D-III or D-IV. In Michigan this category would typically include airports with primary runways over 5,000 feet in length.

MASP Airport Classification

For the MASP all airports are classified by approach category and design group of the primary runway. The following summarizes the classification of Michigan's 236 public use airports by approach category-design group and by public or private ownership.

| Table 4 | | | | | |
|--|---------------------|----------------------|-----------------------|--------------------|------------|
| Approach Category - Design Group Combinations | | | | | |
| Approach Category | Design Group | Runway Length | Runway Surface | NumAirports | |
| | | | | Pub | Pri |
| A | I | Less than 2,500 feet | Turf | 14 | 93 |
| B | I | Less than 3,500 feet | Paved | 28 | 14 |
| B | II | 3,500 to 4,300 feet | Paved | 39 | 7 |
| C | II | 4,300 to 5,000 feet | Paved | 14 | 0 |
| C | III or IV | 5,000 feet or more | Paved | 7 | 0 |
| D | III or IV | 6,000 feet or more | Paved | 20 | 0 |

Other approach category-design group combinations are possible. Actual and recommended airport designations are based upon the fleet mix of aircraft currently operating, or forecasted to operate, at a particular airport.

Examples of common aircraft found in each Airport Reference Code (ARC) follow...

- ☐ A-I Beech Bonanza, Cessna 172, Piper Cherokee
- ☐ B-I Cessna 310, Beech Baron, Piper Navajo
- ☐ B-II Beech King Air 200, Cessna Citation II, Dassault Falcon 20
- ☐ C-II Grumman Gulfstream II, Learjet 25 & 55, Hawker

- 125, Canadair Challenger
- ☐ C-III Boeing 727 & 737, McDonnell Douglas DC-9
- ☐ D-III Boeing 747, McDonnell Douglas DC-10, L-1011

MASP Classification and Priorities

The *MASP 2000*, from a state perspective, assigns airports to one of three tiers based on an airport's ability to respond to state goals and objectives as described in Chapter 5.

Tier 1 airports respond to essential/critical state airport system goals and objectives. These core airports should be developed to their full and appropriate level.

Tier 2 airports complement the essential/critical state airport system and/or respond to local community needs. Focus at these facilities should be on maintaining infrastructure with a lesser emphasis on facility expansion.

Tier 3 airports duplicate services provided by other airports and/or respond to specific needs of individuals and/or small businesses. These facilities are secondary to meeting the overall state system goals and only receive minimal safety enhancements such as runway cones and wind socks.

Airport Service Areas

The value of aviation facilities is related to its proximity to population centers, business centers, tourism/convention centers, and other aviation related traffic generators. The closer an airport is located to these areas, the greater its value as a transportation resource. Beyond certain travel thresholds, airports may have a reduced transportation value.

The analytical tool used in alternative development and analysis within *MASP 2000* utilizes the Statewide Travel Demand Model used historically for highway analysis within Michigan. This model divides the state into 2,307 Transportation Analysis Zones (TAZ), each generally a township or smaller in size. Each of these zones has a variety of socio-economic data assigned to it including current and forecasted population, employment, etc. Each travel analysis zone is connected to all other zones using the actual highway network with appropriate speeds and travel times. This permits an analysis of travel time between all zones.

Early in the *MAASP 2000* development all of the public use airports were inserted into the Statewide Model Network. This entailed locating the airports in system, attaching physical and operational characteristics to them, and building a link to the highway network. This enabled planning professionals to evaluate alternative system plan goals utilizing Geographic Information System (GIS) technology..

Forecast of Future Activity

FORECAST OF FUTURE ACTIVITY

The forecast of activity identifies the number of based aircraft at each public use airport in Michigan and the number and type of operations at each of those facilities for the base year (1998), and each of the target years (2005, 2010, and 2020).

Forecasting aviation activity in the state of Michigan is an integral part of the **MASP 2000**. Forecasts allow planning officials to anticipate and prepare for changes in aviation activity and the demand that these changes place on the system's infrastructure. The **MASP 2000** is designed to identify and assess development needs at airports that will play an essential role in the economic and social development of Michigan. Forecasts will also assist in the identification of airports in need of capital improvements and provide a guide for programming federal and state development funds.

To predict aircraft activity, **MASP 2000** focuses on two important measures of activity: based aircraft and aircraft operations. This chapter examines historical trends in based aircraft and operations activity levels, describe forecasting methods and the growth factors expected over the next 20 years, and comment on trends in aviation as a whole in the state of Michigan.

Forecast Trends

Prior to generating growth forecasts for based aircraft and operations in the state of Michigan, several other forecast sources were identified and assessed. In addition to examining the FAA's Terminal Area Forecast, a variety of other sources including the National Business Aviation Association, General Aviation Manufacturers Association (GAMA), and the National Air Transportation Association (NATA) were explored.

FAA Growth Outlook

The FAA publishes a Terminal Area Forecast (TAF) for each airport in the National Plan of Integrated Airports System (NPIAS) using historical based aircraft counts as the primary indicator of activity. The FAA's General Aviation forecast projects nationwide a 1 percent annual growth in the general aviation fleet through the year 2009; to 212,960 aircraft. General aviation hours flown are projected to increase by 1.4 percent. Active pilots are forecasted to increase by 2.1 percent. Aircraft operations at FAA control tower airports throughout the US will see an annual increase of 2.1 percent. Non-towered airports, which represent about 94 percent of all airports in Michigan, are forecasted to have no growth in based aircraft or operations over the FAA forecast period. Detailed historic records at Michigan non-towered airports indicate that a "no growth" alternative for these airports is unlikely. Rather an MDOT growth outlook based on historical trends that project a modest increase in based aircraft and operations is more likely to occur.

MDOT Growth Outlook

MDOT pursued an alternate forecast that is felt to more accurately model expected growth in Michigan's general aviation community. These forecasts are based on the application of linear regression to the historical activity levels in both based aircraft and operations. Trends were established using 1988-1998 data gathered through field inspections, the Aircraft Traffic Counter Program and Control Tower Activity Reports and information contained in the Transportation Management System (TMS) and the Aviation Information Management System (AIMS). Understanding that past trends are not always accurate indicators of the future, some qualitative analysis of the numerical results was undertaken to calibrate the models and to modify extreme anomalies based on field experience.

In order to forecast based aircraft and total operations at each airport, study participants concluded that separate regression analyses be run for individual FAA group classifications within each planning region of the state. Airports in the C-II/III and D-III classifications are so few in number, that it was decided to combine them into one statewide group to run the analyses. In each case, based aircraft analysis and operations analysis were run separately resulting in unique forecast curves for each airport classification and region of the state. A detailed discussion of the linear regression model used for forecast preparation can be found in the *MASP 2000 Technical*

Supplement.

MASP Forecasts

Using the linear regression technique discussed previously, the anticipated growth in the number of based aircraft and total operations was determined for the years 2005, 2010, and 2020.

Based Aircraft

The number of based aircraft in Michigan is expected to grow 7.0 percent between 1998 and 2020 to almost 7,400.

Figure 1
Based Aircraft Historic and Forecast Trends

Over the past 5 years, the number of based aircraft has decreased slightly from 6,957 aircraft in 1994 to 6,914 in 1998 -- a 0.6 percent decline. The regression analysis indicates that this decline is reversing and modest increases are anticipated by the end of the forecast period. The number of based aircraft at each airport is detailed in Appendix A.

| Table 5 Forecasted Based Aircraft in Michigan 1998-2020 | | |
|--|----------------|----------------------|
| Year | Based Aircraft | Pct Change from 1998 |
| 1998 | 6,914 | na |
| 2005 | 7,095 | 2.6 |
| 2010 | 7,196 | 4.1 |
| 2020 | 7,397 | 7.0 |

The distribution of based aircraft by airport classification is displayed in Figure 2.

Figure 2
Based Aircraft Distribution, 2020

Although C and D category airports represent only 18 percent of the total airports, they have 44 percent of the total based aircraft. At the other extreme, A-I airports represent 45 percent of the total number of airports but have just 9 percent of the based aircraft.

Figure 3 displays the average number of based aircraft by airport classification. As expected, the most developed airports, the D-III and C-III facilities, have the greatest average number of based aircraft with more than 100 per airport. At the opposite end of the spectrum the least developed airports, A-I facilities, have the lowest average number of based aircraft with 6 per airport. From 1998 to 2020 it is interesting to note that the greatest growth in average number of based aircraft will occur at the "B" category airports, with the other airport categories remaining somewhat stable. It appears that as small

single engine aircraft are replaced with higher performance aircraft at the most developed airports, those smaller aircraft will be shifting to the "B" category airports.

Figure 3

Average Number of Based Aircraft Per Airport, 1998-2020

The data in Table 6 indicates that B-I and B-II airports are expected to show the greatest growth in based aircraft while the larger C and D class airports are expected to experience a slight decrease in based aircraft.

Table 6
Based Aircraft By Airport Classification

| Airport Class | Total Based Aircraft by Airport Classification | | | | Percent Change 1998-2020 |
|---------------|--|-------|-------|-------|-----------------------------|
| | 1998 | 2005 | 2010 | 2020 | |
| A-I | 663 | 693 | 693 | 692 | 4.4 |
| B-I | 1,166 | 1,239 | 1,295 | 1,409 | 20.8 |
| B-II | 1,787 | 1,890 | 1,947 | 2,060 | 14.5 |
| C-II | 495 | 493 | 492 | 488 | (1.4) |
| C-III | 673 | 670 | 668 | 663 | (1.5) |
| D-III | 2,130 | 2,110 | 2,102 | 2,085 | (2.1) |
| Total | 6,914 | 7,095 | 7,196 | 7,397 | 7.0 |

Figure 4 displays the trends in based aircraft by MDOT region.

Figure 4
Based Aircraft By MDOT Region, 1998-2020

Of the seven MDOT regions, only the University and Southwest regions are expected to exhibit a reduction in the total number of based aircraft. The remaining regions will experience growth with the greatest increase occurring in the Grand region.

| Table 7 Based Aircraft By MDOT Region | | | | | |
|--|-------------------------------------|-------|-------|-------|-----------------------------|
| Region | Total Based Aircraft by MDOT Region | | | | Percent Change 1998-2020 |
| | 1998 | 2005 | 2010 | 2020 | |
| Bay | 886 | 927 | 959 | 1,023 | 15.5 |
| Grand | 685 | 745 | 790 | 879 | 28.3 |
| Metro | 2,189 | 2,213 | 2,238 | 2,290 | 4.6 |
| North | 663 | 717 | 729 | 752 | 13.4 |
| Southwest | 855 | 851 | 839 | 816 | (4.6) |
| Superior | 295 | 304 | 309 | 317 | 7.5 |
| University | 1,341 | 1,338 | 1,332 | 1,320 | (1.6) |
| Total | 6,914 | 7,095 | 7,196 | 7,397 | 7.0 |

Operations

The number of aircraft operations in Michigan are expected to grow by 27.9 percent between 1998 and 2020 to 5.6 million total operations.

Figure 5
Aircraft Operations Historic and Forecast Trends

While based aircraft figures have remained stable in recent years, aircraft operations have grown from 3.9 million in 1988 to 4.4 million in 1998 -- a 13.2 percent increase. During this period itinerant operations grew at a faster pace, 15.0 percent, than local operations which grew by just 10.7 percent. This trend is expected to continue where the growth in itinerant operations will outpace the growth in local operations -- 35.1 percent to 17.3 percent respectively. The statewide forecast figures for itinerant, local and total aircraft operations are identified in the following table. The total number of current and forecasted operations at each of the 236 airports is found in Appendix A.

| Table 8 Forecasted Total Aircraft Operations 1998 to 2020 | | | | |
|--|-------------------------|-----------------------------|-------------------------|-----------------------------|
| Year | Local Operations | Itinerant Operations | Total Operations | Pct Change from 1998 |
| 1998 | 1,771,614 | 2,599,333 | 4,370,947 | na |
| 2005 | 1,861,300 | 2,890,400 | 4,751,700 | 8.7 |
| 2010 | 1,937,500 | 3,106,600 | 5,044,100 | 15.4 |
| 2020 | 2,078,600 | 3,511,000 | 5,589,600 | 27.9 |
| Pct Change 1998-2020 | 17.3% | 35.1% | 27.9% | |

The distribution of aircraft operations by classification of airport is displayed in Figure 6.

Figure 6
Total Aircraft Operations Distribution, 2020

As before, C and D category airports represent only 18 percent of the total public use airports but have 64 percent of total operations. At the opposite extreme, A-I airports with 45 percent of the total airports, have just 5 percent of total aircraft operations.

Figure 7
Total Operations Per Airport, 1998-2020

Figure 7 displays the average number of total operations by airport classification. As expected, the most developed airports have the greatest number of total aircraft operations. Airports in category D-III average more than 100,000 total annual operations. Airports in category A-I average approximately 2,000 total annual operations. Aircraft operations in all airport classifications are forecasted to increase.

| Table 9 Operations Forecast By Airport Classification | | | | | |
|--|------------------|------------------|------------------|------------------|---------------------------------|
| Class | 1998 | 2005 | 2010 | 2020 | Pct Change 1998-2020 |
| A-I | 221,560 | 259,000 | 268,800 | 288,200 | 30.1 |
| B-I | 466,440 | 561,300 | 635,300 | 783,000 | 16.8 |
| B-II | 893,959 | 1,014,500 | 1,107,100 | 1,253,000 | 40.2 |
| C-II | 297,378 | 305,200 | 324,000 | 362,800 | 22.0 |
| C-III | 355,799 | 365,300 | 387,600 | 434,300 | 22.1 |
| D-III | 2,135,811 | 2,246,400 | 2,321,300 | 2,468,400 | 15.6 |
| Total | 4,370,947 | 4,751,700 | 5,044,100 | 5,589,700 | 27.9 |

Although D-III airports will continue to contribute the largest number of operations over the forecast period, the smaller B-I and B-II class airports will each experience an increase of more than 300,000 total operations.

Figure 8 displays the trends in total operations by MDOT region.

Figure 8
Total Operations By MDOT Region, 1998-2020

All regions are expected to have an increase in total operations. The Grand region, followed closely by the University region, is expected to show the greatest overall growth in aviation activity.

Table 10
Operations Forecast By MDOT Region

| Region | 1998 | 2005 | 2010 | 2020 | Pct Change 1998-2020 |
|--------------|------------------|------------------|------------------|------------------|-------------------------|
| Bay | 507,381 | 565,700 | 605,500 | 681,900 | 34.4 |
| Grand | 410,191 | 473,700 | 514,800 | 595,600 | 45.2 |
| Metro | 1,519,229 | 1,607,000 | 1,682,300 | 1,831,900 | 20.6 |
| North | 449,816 | 481,700 | 521,100 | 559,000 | 24.3 |
| Southwest | 477,886 | 507,000 | 519,100 | 546,000 | 14.3 |
| Superior | 248,578 | 270,900 | 285,200 | 314,900 | 26.7 |
| University | 757,866 | 845,700 | 916,100 | 1,060,400 | 39.9 |
| Total | 4,370,947 | 4,751,700 | 5,044,100 | 5,589,700 | 27.9 |

Goals and Objectives

GOALS AND OBJECTIVES

Issue Identification

As part of the development of the Michigan Airport System Plan, the study team, including both MDOT staff and the Steering Committee, examined issues affecting air transportation in Michigan. The results of that examination are summarized below.

Preservation of Endangered Airports

There are 236 public use airports currently in operation throughout Michigan. At any given time several of these facilities are under pressure from local officials and/or developers to be closed and converted to an alternate use. These pressures are most often exerted on small general aviation airports operating in or adjacent to their service communities. This is a particular concern to airports operating in Southeast Michigan where additional airport closures would threaten overall regional capacity. Generally, public use airports, from a preservation perspective, fall into one of four categories. (1) The airport is the only public use facility serving the area and should be preserved because of the access it provides to the community and access it provides the community to outside services. (2) The airport is in an area where regional aircraft capacity is stressed and the facility needs to be preserved to assure continued regional capacity. (3) The airport functions as a reliever to a large airport by allowing lower performance aircraft to utilize the smaller airport rather than the larger airport where the number of operations by high performance aircraft would be inhibited by the smaller aircraft. At very busy airports, a mix of slow aircraft and faster, heavier aircraft severely affects operational capacity. Preservation of a smaller airport that would provide an alternative to a very busy

airport would benefit both types of aircraft operations. (4) The airport duplicates service that is already provided by another airport in reasonable proximity. Where a community is served by more than one airport, efforts should be undertaken to assure the continued operation of the airport that is best suited to respond to the current and ultimate aviation needs of that community.

Preservation of Airport Infrastructure

MDOT's emphasis on maintaining the integrity of pavements at airports throughout Michigan should continue. As pavement ages, more and more funding resources are being focused on rebuilding and reconstructing airport pavements. Since 1987 pavement condition evaluations have been conducted at many airports throughout the state. The resulting data has provided the department and local airport sponsors with the information needed to assist in the management of pavement life and the appropriate timing of pavement rehabilitation/reconstruction actions.

Access to Population Centers

Significant population centers generate and attract a wide range of general aviation operations including flights for business, freight, cargo, medical emergencies, search and rescue, law enforcement, training, etc. The presence of a year-round general aviation facility to serve these trip needs is an essential component of a well rounded, full service community.

Access to Business Centers

Significant economic and manufacturing production centers require a wide range of transportation facilities to respond to product and people moving needs. Airports can respond to the product movement needs by permitting the rapid, timely movement of parts and products critical to economic vitality. Timely movement of executives, key personnel and clients between production centers can also be accomplished through development of general aviation airport facilities that provide the full range of services.

Access to Tourism/Convention Centers

In Michigan, the tourism and convention industry is a four-season, rapidly-expanding component of the state's overall economic well being. Access to tourist and convention areas, not only from within Michigan but also from throughout the mid-west and nation, can be effectively provided through properly developed airport facilities. In a number of locations, primarily in northern Michigan and in shoreline communities, the local area is as dependent on the tourism/convention industry as the Detroit area has historically been dependent on the automobile industry.

Access to Isolated Areas

There are seven populated Great Lakes islands that for at least a portion of the winter months are without ferry service and consequently seasonally isolated. During these periods air transportation provides the only reliable access between the mainland and these islands. In these cases island populations are dependent on aviation to provide emergency and other essential access. In 1996 both the Michigan State Transportation Commission and the Michigan Aeronautics Commission adopted an *Island Transportation Policy*. Islands affected by this include Beaver, Bois Blanc, Drummond, Harsens, Mackinac, Neebish and Sugar islands.

Compatible Land Use and Zoning

Historically, airports were developed in rural areas near the communities they serve. Over time, however, urban development in many instances has grown out to the airport environs. Where land use zoning is ineffective, non-compatible land uses such as residential areas, schools and churches can locate under airport approaches where the resulting noise can cause serious problems between airports and area residents. Additionally, inappropriate land uses in a runway approach have a negative effect on the type of approach, which impacts minimum weather conditions that an aircraft can safely approach an airport. Effective local airport zoning can prevent this situation from worsening by limiting development in these areas to compatible land uses such as agriculture, parks, commercial and industrial uses. Effective local airport zoning is a concern to the state. Zoning decisions are the responsibility local government and local airport zoning boards.

Interface With Other Modes of Transportation

Rather than viewing an airport as the beginning or ending point of a

trip, it should be viewed as a transfer point from one mode of transportation to another. Not only is efficient and effective movement of people and goods dependent on an appropriately developed airport, but also on appropriate access to the airport, and efficient transfer from the surface mode to the air mode. At the most demanding airports, this may entail highways that can accommodate significant traffic volumes, public transportation services, and significant passenger and cargo movements. A variety of access enhancement actions may be appropriate ranging from infrastructure improvements to traffic control devices.

All-Weather Airport Access

During periods of low clouds and reduced visibility, an airport can only be used with the aid of instruments which allow flight through the poor weather conditions. By using Instrument Flight Rules (IFR) a pilot can fly an aircraft safely when cloud ceilings and visibility limits do not allow flight by visual means. Additionally, IFR allow a pilot to descend to minimum safe altitudes and allow the pilot to see the runway and land safely.

The precision of the navigational landing aids, both in the cockpit and on the ground, determines the minimum altitude and visibility a pilot can safely encounter and see the runway to land. The higher the minimums, the more frequently a pilot has to divert to an alternate airport during periods of adverse weather conditions. An airport's utility to the business community, as well as other users, is enhanced by increasing the precision of the navigational landing aids available. In Michigan, this is particularly important where the Great Lakes often affect weather conditions that impact aircraft operations. To this end, the Michigan Aeronautics Commission in 1999 adopted an *All Weather Airport Access Plan*. Features of that plan are incorporated into the *MASP 2000*.

Airport Services

The range of services provided at airports varies significantly. Basic aircraft services include fuel, aircraft repair, and hangar facilities available during normal business hours. Basic pilot services include telephone, restrooms, and access to shelter.

State Long-Range Plan

The State Long-Range Plan (SLRP) Statewide Planning Process

included a 60-member Customers and Providers Advisory Committee that assisted in the development of the SLRP. The committee's members came from a wide variety of statewide organizations, representing both those who use the transportation services and those who provide them. The Committee met and discussed transportation issues for over one year to develop the following seven statewide goals that have subsequently been adopted by the State Transportation Commission to set policy direction for transportation decisions throughout the state.

Service Coordination - Create incentives for coordination between public officials, private interests and transportation agencies to improve safety, enhance or consolidate services, strengthen intermodal connectivity, and maximize the effectiveness of investments for all modes by encouraging regional solutions to regional transportation problems.

Land Use Coordination - Coordinate local land use planning, transportation planning and development to maximize the use of existing infrastructure, increase the effectiveness of investment, and retain or enhance the vitality of the local community.

Basic Mobility - Work with general public, public agencies and private sector organizations to ensure basic mobility for all Michigan citizens by, at a minimum, providing safe, efficient and economical access to employment, educational opportunities, and essential services.

Preservation - Within the constraints of state and federal law, direct investment in existing transportation systems to effectively provide safety, mobility, access, intermodal connectivity, or support economic activity and the viability of older communities, and ensure that the facilities and services continue to fulfill their intended functions.

Intermodalism - Improve intermodal connections to provide "seamless" transportation for both people and products to and throughout Michigan.

Environment and Aesthetics - Provide transportation systems that are environmentally responsible and aesthetically pleasing.

Moving into the 21st Century - Provide transportation infrastructure and services that strengthen the economy and competitive position of Michigan and its regions for the 21st century.

Michigan Airport System Plan Goals

In response to the previously discussed aviation issues and the long range goals as described in the State Long-Range Plan, a series of Michigan Airport System Plan goals have been established. These goal statements can be divided into system goals and facility goals. The system goals relate to the capability of system airports to respond to air transportation needs of Michigan's residents, visitors and the business community. Facility goals relate to the establishment of minimum airport development standards that adequately describe essential airport facility characteristics.

MASP System Goals

Serve Significant Population Centers - Provide service to significant population centers through year-round general aviation facilities.

Serve Significant Business Centers - Support an airport system that adequately and effectively responds to the critical business aviation needs of the state.

Serve Significant Tourism/Convention Centers - Support an airport system that adequately and effectively responds to the significant tourism/convention aviation needs of the state.

Provide the General Population Access to the Aviation System - Preserve and develop the system of airports necessary to respond to basic aviation needs of the general population.

Provide Adequate Land Area Coverage - Preserve and develop the system of airports necessary to provide basic land area coverage.

Preserve Regional Capacity - Preserve adequate airport capacity in each region of the state to assure continued effective air transportation.

Serve Isolated Areas - Support aviation facilities capable of providing essential transportation services during those times of the year when other transportation modes are unavailable to isolated areas.

MASP Facility Goals

Complete and Adequate Primary Runway System - Airports designated in Tier 1 of the state airport system should have a complete and adequate runway system including: a paved runway of appropriate length, width and strength; an appropriate runway lighting system; access from the terminal apron area to the primary runway; a parallel taxiway when appropriate based on airport classification and/or activity level; and clear approaches with the appropriate glide slope.

Pavements in "Good" Condition - Airports designated in Tier 1 or Tier 2 of the state airport system should have pavements in their *primary runway system* in "good" condition.

All Weather Access - Airports designated in Tier 1 of the state airport system should have all weather access. This includes an Automated Weather Observation System (AWOS) or equivalent, a Pilot Information System to access national weather information for flight planning, and a direct communication capability between the pilot and the appropriate ATC.

Year-round Operation - Airports designated in Tier 1 of the state airport system should be open throughout the year. This means the airport should be staffed throughout the year, be able to clear the runway of snow in a timely fashion, have at least one paved runway that would not be affected by spring thaw conditions, and provide a basic level of pilot/aircraft services.

Basic Pilot and Aircraft Services - Airports designated in Tier 1 or Tier 2 of the state airport system should have an appropriate range of pilot and aircraft services. These services include telephone, restrooms, access to shelter, fuel and aircraft services.

Airport Zoning - Airports designated in Tier 1 of the state

airport system should have a current airport zoning plan and an active airport zoning board.

Appropriate Instrument Approaches - Airports designated in Tier 1 or Tier 2 of the state airport system should have the appropriate two-dimensional or three-dimensional instrument approach system that permits reliable air operations in inclement weather conditions.

Appropriate Surface Access - Airports designated in Tier 1 of the state airport system should have appropriate highway, rail and/or public transportation access responsive to both the volume and type of vehicular traffic requiring airport access.

Relationship Between MASP Goals and SLRP Goals

The relationship between the State Long Range Plan goals and the goals of the Michigan Airport System Plan are displayed in Table 12. Although a high relationship has been identified between the two plans in many areas, the strongest relationship has been identified with "preservation" from the SLRP perspective. The strongest linkage with the *MASP 2000* has been identified with "serve business and tourism/convention centers." This linkage indicated that system preservation and service to business and tourism/convention centers should have a high emphasis throughout the plan.

| Table 11 Relationship of Michigan Airport System Plan Goals and State Long-Range Plan Goals | | | | | | | |
|---|-----------------------------|--------------------------|----------------|--------------|---------------|-----------------------------|-----------------------------|
| MASP Goals | State Long-Range Plan Goals | | | | | | |
| | Service Coordination | Land Use Coordination | Basic Mobility | Preservation | Intermodalism | Environment & Aesthetics | Moving into 21st Century |
| MASP System Goals | | | | | | | |
| Preserve Essential Regional Access | H | H | H/M | H | H | H | H |
| Preserve Regional Capacity | M | H | M | H | H | M/L | H |
| Serve Population Centers | H/M | H | H | H | H | H | H |
| Serve Business & Tourism/Convention Centers | H | H | H | H | H | H | H |
| Serve Isolated Areas | M/L | M/L | H | H | L | H | L |
| MASP Facility Goals | | | | | | | |
| Complete & Adequate Primary Runway System | L | H | M | H | L | M | H |
| Pavements in "Good" Condition | L | L | M | H | L | M | H |
| All Weather Access | M | L | H | M | L | M | H |
| Year-Round Operation | M | L | H | M | L | M | H |
| Pilot Services | M | L | H | L | M | L | H |
| Appropriate Instrument Approaches | M | H | H | M | L | M | H |
| Airport Zoning | L | H | M | H | M | H | M |
| Appropriate Surface Access | H | H | H | H | H | M | H |
| Notes: "H" indicates a high linkage between the MASP and SLRP. "M" indicates a moderate linkage between the MASP and SLRP. "L" indicates a low linkage between the MASP and the SLRP. | | | | | | | |

Goal Development and System Recommendations

GOAL DEVELOPMENT AND SYSTEM RECOMMENDATIONS

Each of the seven MASP system goals has undergone a series of alternatives analysis resulting in a recommendation for the ultimate airport system for each goal in the year 2020. Alternative development involved establishing and testing various combinations of service standards for each system goal. Included for each alternative was a variety of surface travel time, minimum airport classification, and service thresholds. Surface travel time combinations tested included 15, 20, 30, and 45 minutes for many of the system goals. Generally, a surface travel time of 30 minutes resulted in a system that appropriately responsive. Service threshold combinations were tested at 90, 95 and 100 percent. In most cases a 90 percent service threshold left too many holes in the system; and a 100 percent threshold resulted in a system that would be overbuilt. Results of that analysis, including a summary of how well the current system is responding to future needs are presented for each system goal in the following section of the MASP report.

Serve Significant Population Centers

Goal: Provide service to significant population centers through year-round general aviation facilities.

Background: Population centers are defined as a minor civil division (MCD) of 5,000 or more people with a population density of 250 or more per square mile. In 1995 there were 246 population centers meeting this criteria. The 2020 forecast indicates that there will be 295 population centers meeting this criteria. Map 2 identifies the location of the population centers in 2020.

Map2

Population Centers in Michigan, 2020

System Standards: The population centers system standard relates to the proximity of an airport to a population center, the minimum classification of airport needed to adequately respond to population centers and the performance target percent for population centers to be served by those airports. Table 12 summarizes the system standards for population centers.

| Table 12 System Standards: Population Centers | |
|--|-------------|
| Surface Travel Time | 30 minutes |
| Minimum Airport Classification | C-II |
| Tier 1 Performance Target | 95 percent |
| Tier 2 Performance Target | 100 percent |

As described previously, the statewide travel demand model is the analytical tool used to determine the proximity of airports to population centers. That tool was used to determine the service area coverage of all candidate airports and the number and size of population centers served by those airports. In summary, population centers in Michigan should be served within 30 minutes surface travel time by airports in the C-II classification. Those airports needed to respond to 95 percent of the population centers are included in Tier 1; with the airports needed to respond to 100 percent of the population centers included in Tier 2.

System Recommendation: To the extent possible, airports that were currently serving population centers and developed to the proper minimum airport classification were selected for inclusion in the population center alternative. Additional airports to be included in Tier 1 were selected based on a combination of population center size, remoteness from a previously included airport, and the number of additional population centers that would be served. The airports selected for inclusion in the preferred alternative and their 30 minute surface travel time are displayed in Map 3. Among the 32 airports included in Tier 1 for population centers are three airports that would require a reclassification to the C-II category. These airports are...

- ☐ Adrian, Lenawee County Airport
- ☐ Greenville Municipal Airport
- ☐ Howell, Livingston County Airport

The other 29 airports currently meet the C-II airport classification standard. All 32 Tier 1 airports are identified in Table 14.

Map 3

Population Centers: Tier 1 Airport System

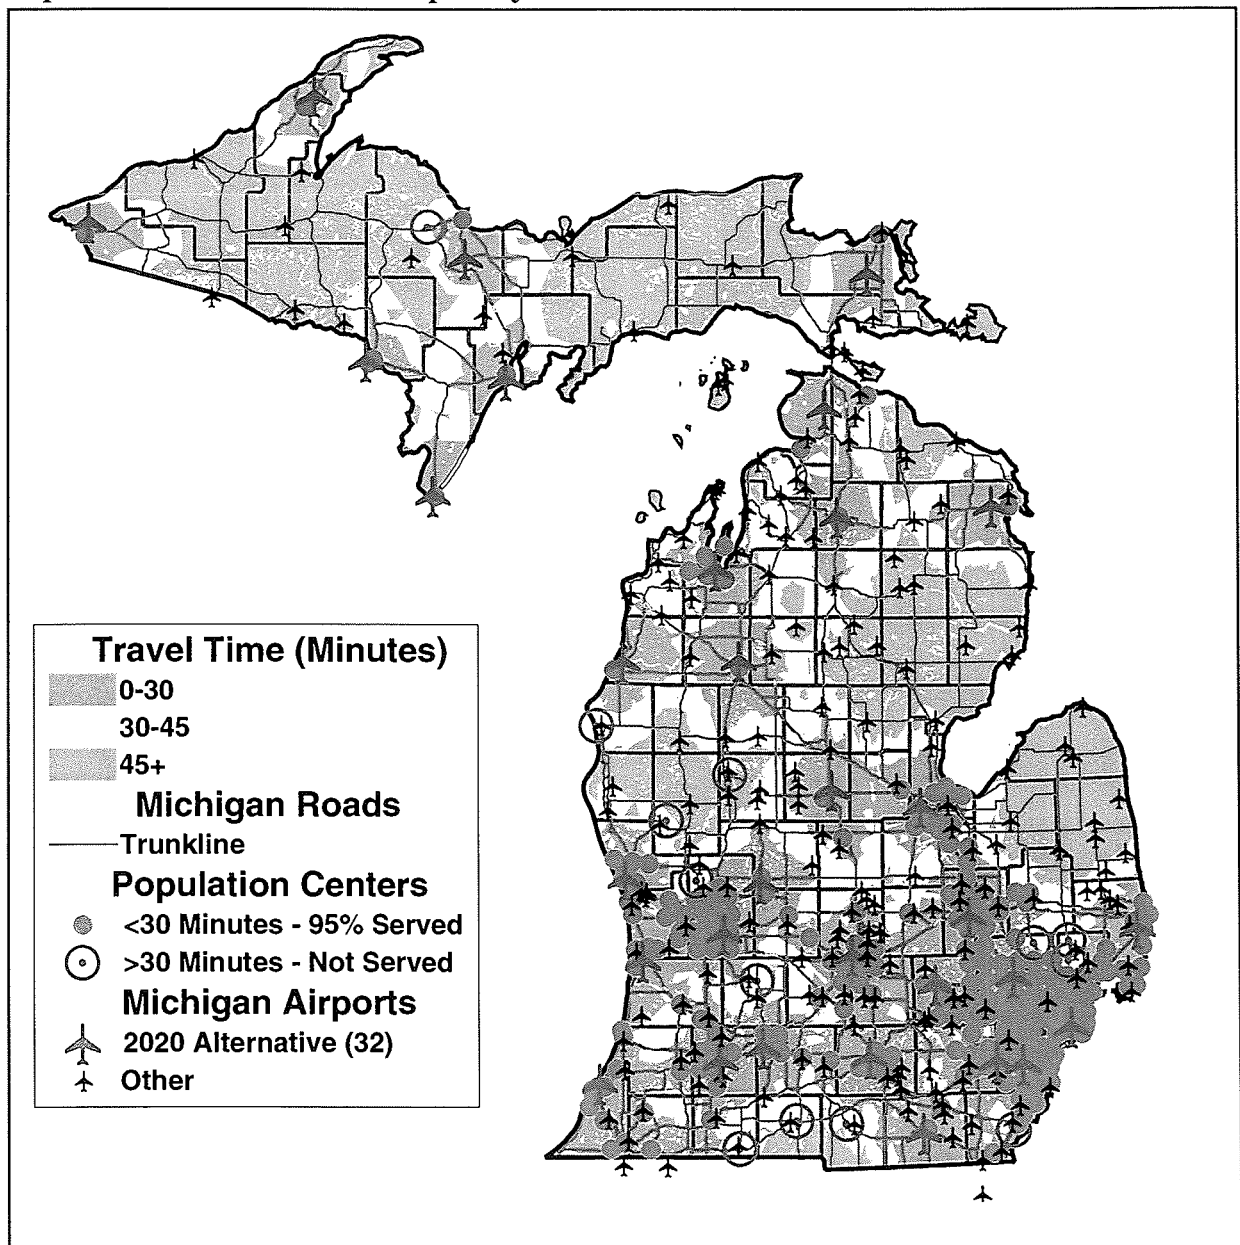

Table 13
Tier 1 Airport System: Population Centers

Minimum Airport Classification Standard: C-II

| City | Airport | Current Class |
|------------------|--------------------------------|---------------|
| Adrian | Lenawee County | B-II |
| Alpena | Alpena County Regional | D-III |
| Battle Creek | W.K. Kellogg | D-III |
| Benton Harbor | Southwest Michigan Regional | C-III |
| Cadillac | Wexford County | C-II |
| Detroit | Detroit City | C-III |
| Detroit | Detroit Metro Wayne County | D-III |
| Detroit | Willow Run | D-III |
| Escanaba | Delta County | D-III |
| Flint | Bishop International | D-III |
| Gaylord | Otsego County | C-III |
| Grand Rapids | Kent County International | D-III |
| Greenville | Greenville Municipal | B-II |
| Hancock | Houghton County Memorial | D-III |
| Holland | Tulip City | C-III |
| Howell | Livingston County | B-II |
| Iron Mountain | Ford | D-III |
| Ironwood | Gogebic-Iron County | D-III |
| Jackson | Jackson County-Reynolds | C-III |
| Kalamazoo | Kalamazoo/Battle Creek Intl. | D-III |
| Lansing | Capital City | D-III |
| Manistee | Manistee County-Blacker | C-II |
| Marquette | Sawyer | D-III |
| Menominee | Menominee-Marinette Twin City | C-III |
| Mt. Pleasant | Mt. Pleasant Municipal | C-II |
| Muskegon | Muskegon County | D-III |
| Pellston | Pellston Regional of Emmet Co. | D-III |
| Pontiac | Oakland County International | D-III |
| Port Huron | St. Clair County International | C-III |
| Saginaw | M B S International | D-III |
| Sault Ste. Marie | Chippewa County International | D-III |
| Traverse City | Cherry Capital | D-III |

Those airports required to achieve a 100 percent population center coverage are designated in Tier 2 and include the ten airports identified in Table 14. Seven of these airports do not currently meet the C-II Airport Classification for population centers.

Table 14
Tier 2 Airport System: Population Centers
Minimum Airport Classification Standard: C-II

| City | Airport | Current Class |
|------------|----------------------------|---------------|
| Big Rapids | Roben-Hood | B-II |
| Coldwater | Branch County Memorial | B-II |
| Fremont | Fremont Municipal | C-II |
| Hastings | Hastings City/Barry County | B-II |
| Hillsdale | Hillsdale Municipal | B-II |
| Ludington | Mason County | B-II |
| Monroe | Monroe Custer | C-II |
| Romeo | Romeo | B-II |
| Sparta | Sparta | B-II |
| Sturgis | Kirsch Municipal | C-II |

Goal Achievement Summary: The system of airports identified in Table 15 results in the following level of performance achievement.

Table 15
Goal Achievement Summary: Population Centers

| | |
|-------------------------------------|-----|
| Number of Tier 1 C-II Airports | 32 |
| Population Centers Served (percent) | 95 |
| Number of Tier 2 Airports | 10 |
| Population Centers Served (percent) | 99+ |

The 32 airports designated for inclusion in Tier 1 meet the target performance objective of 95 percent. The 10 airports included in Tier 2 results in all population centers being served with the exception of Ishpeming. This population center is marginally outside the 30 minute surface travel time for this standard being 31 minutes from Marquette, Sawyer Airport.

Serve Significant Business Centers

Goal: Support an airport system that adequately and effectively responds to the critical and essential business aviation needs of the state.

Background: Business centers in Michigan are defined as Travel Analysis Zones (TAZ) with 3,000 or more employees. There are forecasted to be 450 such zones in the year 2020 with 95 of those zones having 10,000 or more employees. These zones are concentrated in or near the state's major metropolitan areas. A number of zones are also located in or near many Michigan communities across the state. Map 4 displays the location of business centers in Michigan.

Map 4

Business Centers in Michigan, 2020

System Standards: Business centers system standards relate to proximity of an airport to a business center, the minimum classification of airport needed to adequately respond to business centers and the performance target percent for business centers to be served by those airports. Table 16 summarizes the system standards for business centers.

| Table 16 System Standards: Business Centers | |
|--|-------------|
| Surface Travel Time | 30 minutes |
| Minimum Airport Classification | C-II |
| Tier 1 Performance Target | 95 percent |
| Tier 2 Performance Target | 100 percent |

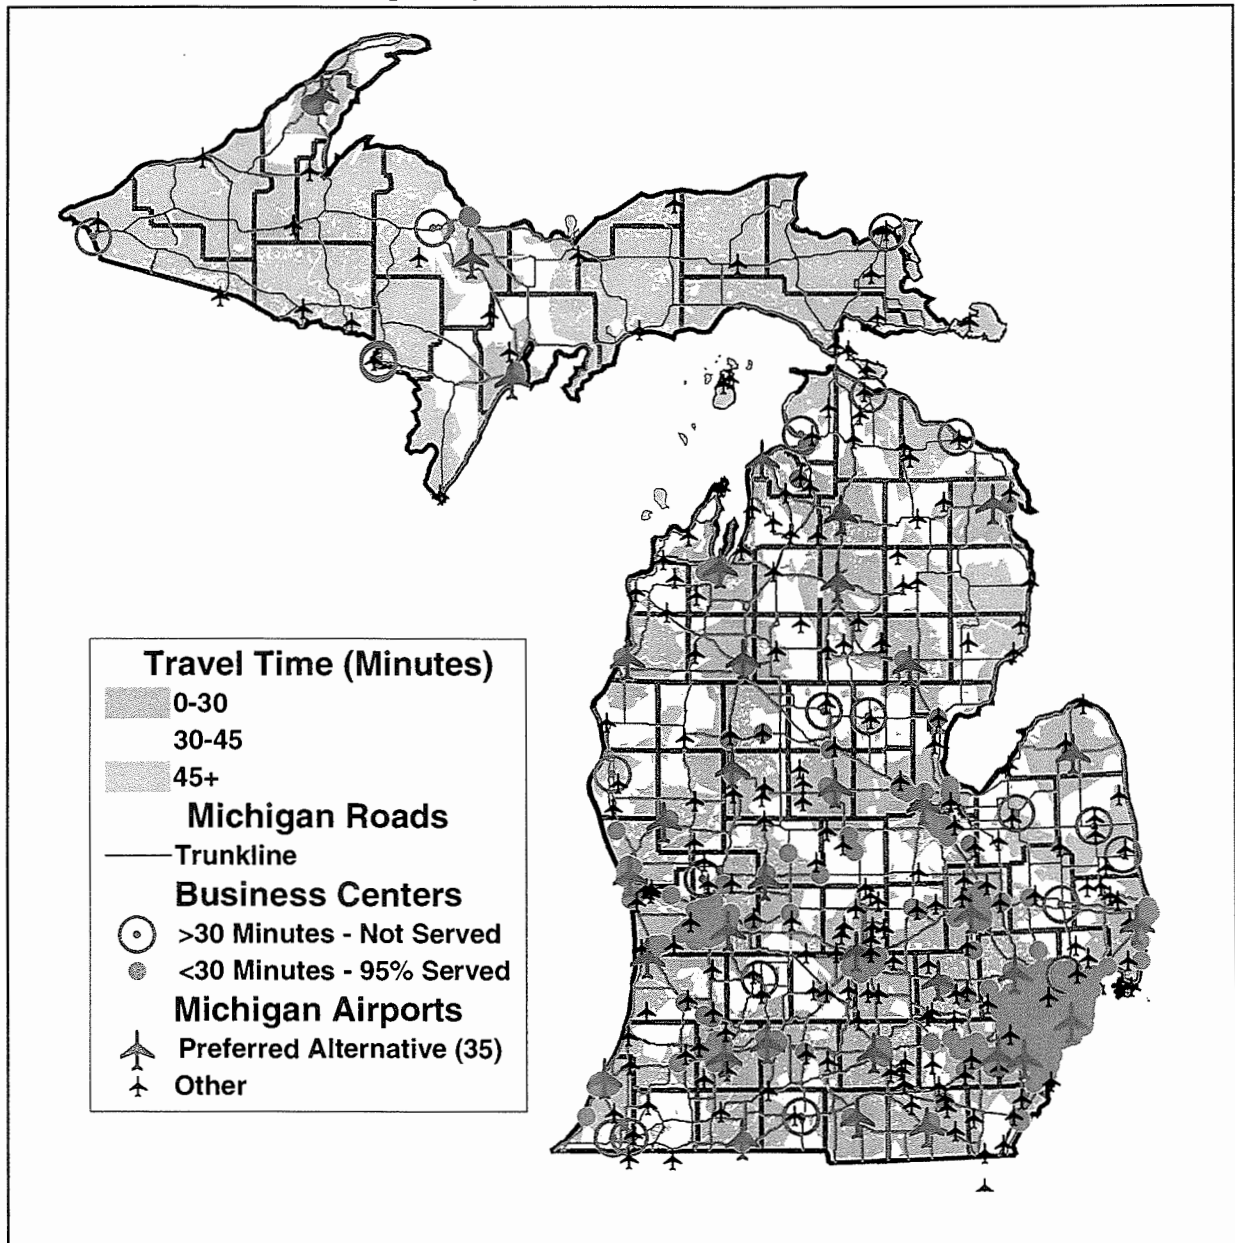

As described previously, the statewide travel demand model is the analytical tool used to determine the proximity of airports to business centers. That tool was used to determine the service area coverage of all candidate airports and the number and size of business centers served by those airports. In summary, business centers in Michigan should be served within 30 minutes surface travel time by airports in the C-II classification. Those airports needed to respond to 95 percent of the business centers are included in Tier 1; with the airports needed to respond to 100 percent of the business centers included in Tier 2.

System Recommendation: To the extent possible, airports that were already developed to the proper minimum airport classification were selected for inclusion in the business center alternative. Additional airports to be included in Tier 1 were selected based on a combination of business center size, remoteness from a previously included airport, and the number of additional business centers that would be served. Among the 35 airports included in Tier 1 for population centers are seven airports that would require a reclassification to the C-II category. These airports are...

- ☐ Adrian, Lenawee County Airport
- ☐ Bad Axe, Huron County Memorial Airport
- ☐ Big Rapids, Roben-Hood Airport
- ☐ Charlevoix Municipal Airport
- ☐ Greenville Municipal Airport
- ☐ Hillsdale Municipal Airport
- ☐ Howell, Livingston County Airport

Map 5

Business Centers: Tier 1 Airport System

The other 28 airports currently meet the C-II airport classification standard. All 35 Tier 1 airports are shown in Map 5 and identified in Table 17.

| Table 17 Tier 1 Airport System: Business Centers Minimum Airport Classification Standard: C-II | | |
|---|--------------------------------|---------------|
| City | Airport | Current Class |
| Adrian | Lenawee County | B-II |
| Alpena | Alpena County Regional | D-III |
| Bad Axe | Huron County Memorial | B-II |
| Battle Creek | W.K. Kellogg | D-III |
| Benton Harbor | Southwest Michigan Regional | C-III |
| Big Rapids | Roben-Hood | B-II |
| Cadillac | Wexford County | C-II |
| Charlevoix | Charlevoix Municipal | B-II |
| Detroit | Detroit City | C-III |
| Detroit | Detroit Metro Wayne County | D-III |
| Detroit | Willow Run | D-III |
| Escanaba | Delta County | D-III |
| Fremont | Fremont Municipal | C-II |
| Flint | Bishop International | D-III |
| Gaylord | Otsego County | C-III |
| Grand Rapids | Kent County International | D-III |
| Grayling | Grayling Army Airfield | C-II |
| Greenville | Greenville Municipal | B-II |
| Hancock | Houghton County Memorial | D-III |
| Hillsdale | Hillsdale Municipal | B-II |
| Holland | Tulip City | C-III |
| Howell | Livingston County | B-II |
| Jackson | Jackson County-Reynolds | C-III |
| Kalamazoo | Kalamazoo/Battle Creek Intl. | D-III |
| Lansing | Capital City | D-III |
| Manistee | Manistee County-Blacker | C-II |
| Marquette | Sawyer | D-III |
| Mt. Pleasant | Mt. Pleasant Municipal | C-II |
| Muskegon | Muskegon County | D-III |
| Pontiac | Oakland County International | D-III |
| Port Huron | St. Clair County International | C-III |
| Saginaw | M B S International | D-III |
| Sturgis | Kirsch Municipal | C-II |
| Traverse City | Cherry Capital | D-III |
| West Branch | West Branch Community | C-II |

Those airports required to achieve a 100 percent population center coverage are designated in Tier 2 and include the 15 airports identified in Table 18. Of these airports, 12 do not currently meet the C-II Airport Classification for business centers.

| Table 18 Tier 2 Airport System: Business Centers Minimum Airport Classification Standard: C-II | | |
|---|---------------------------------|---------------|
| City | Airport | Current Class |
| Ann Arbor | Ann Arbor Municipal | B-II |
| Caro | Caro Municipal | B-II |
| Cheboygan | Cheboygan City-County | B-II |
| Coldwater | Branch County Memorial | B-II |
| Gladwin | Gladwin Zettel Memorial | B-II |
| Hart-Shelby | Oceana County | B-I |
| Hastings | Hastings City/Barry County | B-II |
| Iron Mountain | Ford | D-III |
| Ironwood | Gogebic-Iron County | D-III |
| Lapeer | DuPont-Lapeer | B-I |
| Niles | Jerry Tyler Memorial | B-II |
| Rogers City | Presque Isle County/Rogers City | B-I |
| Sandusky | Sandusky City | B-I |
| Sault Ste. Marie | Sault Ste. Marie Muni-Sanderson | C-II |
| Sparta | Sparta | B-II |

Goal Achievement Summary: The system of airports identified in Table 19 results in the following level of performance achievement.

| Table 19 Goal Achievement Summary: Business Centers | |
|--|----|
| Number of Tier 1 C-II Airports | 35 |
| Business Centers Served (percent) | 95 |
| Number of Tier 2 Airports | 15 |
| Business Centers Served (percent) | 97 |

The 35 airports designated for inclusion in Tier 1 meet the target performance objective of 95 percent. The 15 airports included in Tier 2 results in 97 percent of business centers being served. All of the business centers not served in Tier 1 or Tier 2 are marginally outside of the 30 minute surface travel time. No business center in the state is more than 37 minutes from an airport designated in either Tier 1 or Tier 2.

Additionally, all large business centers, those with 10,000 or more employees, are served by the airports selected for inclusion in Tier 1.

Serve Significant Tourism/Convention Centers

Goal: Support an airport system that adequately and effectively responds to the critical and essential tourism/convention aviation needs of the state.

Background: Tourism and convention centers in Michigan are identified by allocating lodging use taxes generated in each county to the travel analysis zones within each county based on TAZ employment as a percent of total county employment. TAZs with \$30,000 or more of annual lodging use tax generated as reported to the Michigan Department of Treasury are designated as tourism/convention centers. There are 293 tourism/convention centers in Michigan. Generally, these centers are located in or near major urbanized areas like Detroit, Grand Rapids and Lansing, or somewhat concentrated in the northwestern parts of the lower peninsula and eastern portions of the upper peninsula. Map 6 displays the location of tourism/convention centers in Michigan.

Map 6

Tourism/Convention Centers in Michigan, 1995

System Standards: Tourism/convention centers system standards relate to proximity of an airport to a tourism/convention center, the minimum classification of airport needed to adequately respond to tourism/convention centers and the performance target percent for tourism/convention centers to be served by those airports. Table 20 summarizes the system standards for tourism/convention centers.

| Table 20 System Standards: Tourism/Convention Centers | |
|--|-------------|
| Surface Travel Time | 30 minutes |
| Minimum Airport Classification | B-II |
| Tier 1 Performance Target | 95 percent |
| Tier 2 Performance Target | 100 percent |

As described previously, the statewide travel demand model is the analytical tool used to determine the proximity of airports to tourism/convention centers. That tool was used to determine the service area coverage of all candidate airports and the number and size of tourism/convention centers served by those airports. In summary, tourism/convention centers in Michigan should be served within 30 minutes surface travel time by airports in the B-II classification. Those airports needed to respond to 95 percent of the tourism/convention centers are included in Tier 1; with the airports needed to respond to 100 percent of the tourism/convention centers included in Tier 2.

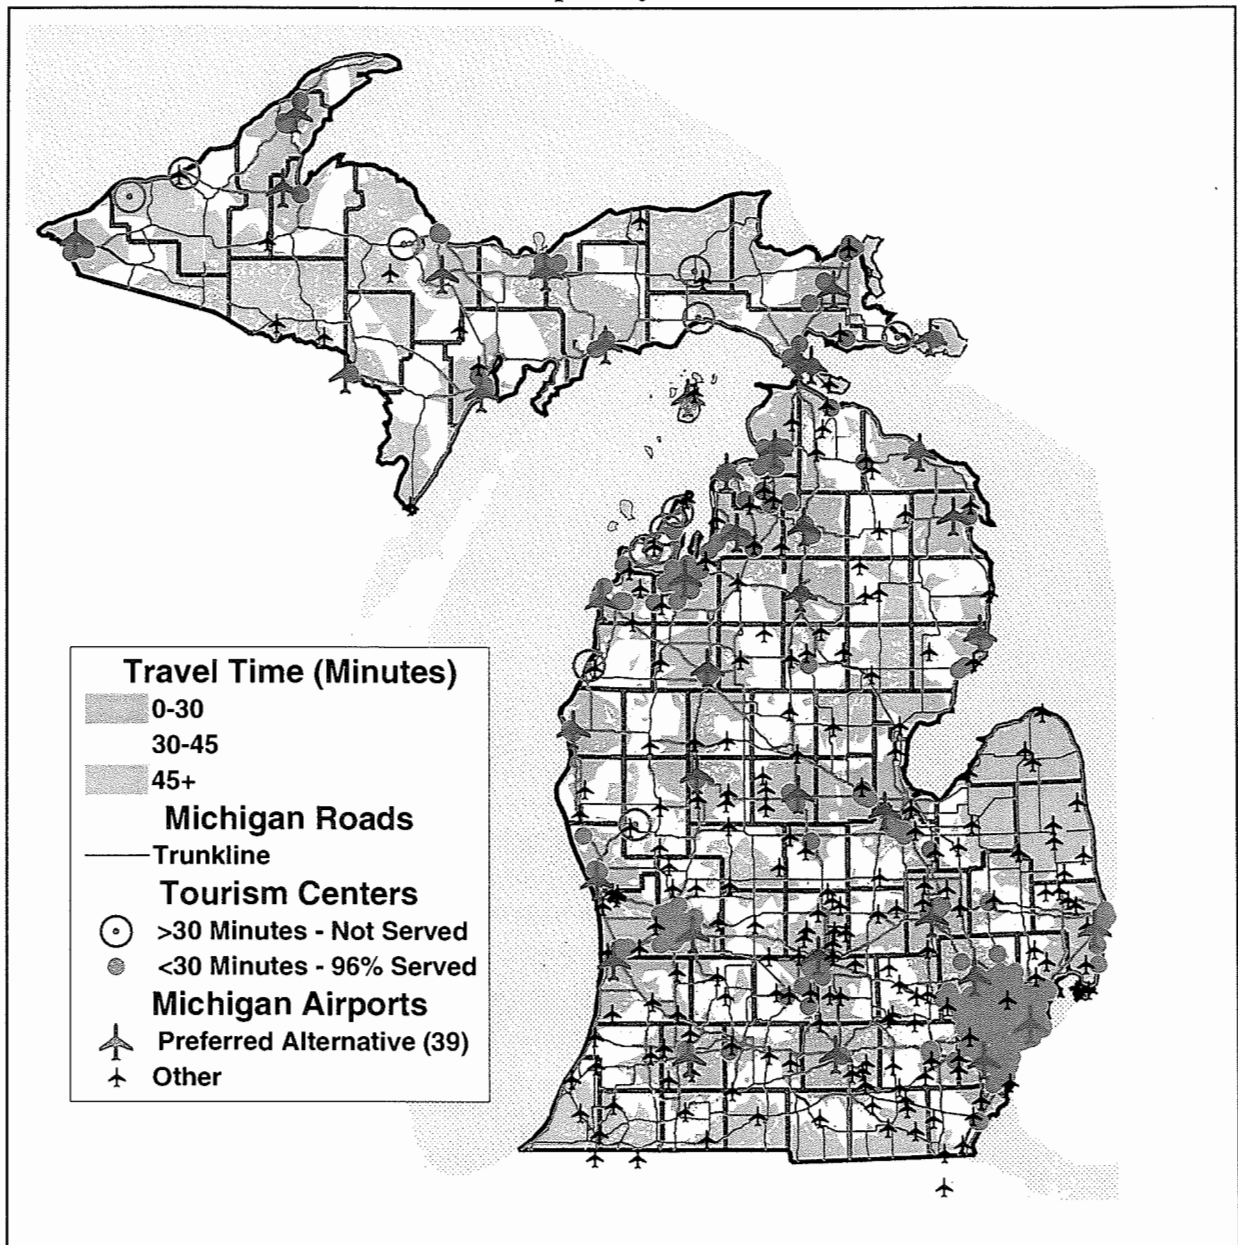

System Recommendation: To the extent possible, airports that were already developed to the proper minimum airport classification were selected for inclusion in the tourism/convention center alternative. Additional airports to be included in Tier 1 were selected based on a combination of tourism/convention center size, remoteness from a previously included airport, and the number of additional tourism/convention centers that would be served. Among the 39 airports included in Tier 1 for tourism/convention centers are five airports that would require a reclassification to the B-II category. These airports are...

- ☐ Baraga, new
- ☐ Frankfort, Dow Memorial Airport
- ☐ Munising, Hanley Field
- ☐ Rogers City, Presque Isle County/Rogers City Airport
- ☐ St. Ignace, Mackinac County Airport

The other 34 airports currently meet the B-II airport classification standard. All 39 Tier 1 airports are shown in Map 7 and identified in Table 21.

Map 7

Tourism/Convention Centers: Tier 1 Airport System

| Table 21 Tier 1 Airport System: Tourism/Convention Centers Minimum Airport Classification Standard: B-II | | |
|---|---------------------------------|---------------|
| City | Airport | Current Class |
| Alpena | Alpena County Regional | D-III |
| Baraga | new | |
| Beaver Island | Beaver Island | B-II |
| Bellaire | Antrim County | C-II |
| Big Rapids | Roben-Hood | B-II |
| Cadillac | Wexford County | C-II |
| Charlevoix | Charlevoix Municipal | B-II |
| Detroit | Detroit City | C-III |
| Detroit | Detroit Metro Wayne County | D-III |
| Drummond Island | Drummond Island | B-II |
| Escanaba | Delta County | D-III |
| Flint | Bishop International | D-III |
| Frankfort | Dow Memorial | B-I |
| Gaylord | Otsego County | C-III |
| Grand Rapids | Kent County International | D-III |
| Grayling | Grayling Army Airfield | C-II |
| Hancock | Houghton County Memorial | D-III |
| Harbor Springs | Harbor Springs Municipal | B-II |
| Holland | Tulip City | C-III |
| Iron Mountain | Ford | D-III |
| Ironwood | Gogebic-Iron County | D-III |
| Jackson | Jackson County-Reynolds | C-III |
| Kalamazoo | Kalamazoo/Battle Creek Intl. | D-III |
| Lansing | Capital City | D-III |
| Ludington | Mason County | B-II |
| Mackinac Island | Mackinac Island | B-II |
| Manistique | Schoolcraft County | C-II |
| Marquette | Sawyer | D-III |
| Mt. Pleasant | Mt. Pleasant Municipal | C-II |
| Munising | Hanley Field | A-I |
| Muskegon | Muskegon County | D-III |
| Oscoda | Oscoda-Wurtsmith | D-III |
| Pontiac | Oakland County International | D-III |
| Port Huron | St. Clair County International | C-III |
| Rogers City | Presque Isle County/Rogers City | B-I |
| Saginaw | M B S International | D-III |
| Saint Ignace | Mackinac County | B-I |
| Sault Ste. Marie | Chippewa County International | D-III |
| Traverse City | Cherry Capital | D-III |

Those airports required to achieve a 100 percent tourism/convention center coverage are designated in Tier 2 and include the ten airports

identified in Table 22. Of these airports, six do not currently meet the B-II Airport Classification for tourism/convention centers.

| Table 22 Tier 2 Airport System: Tourism/Convention Centers Minimum Airport Classification Standard: B-II | | |
|---|---------------------------------|---------------|
| City | Airport | Current Class |
| Caseville | new | |
| Clare | Clare Municipal | B-I |
| Fremont | Fremont Municipal | C-II |
| Manistee | Manistee County-Blacker | C-II |
| Newberry | Luce County | B-I |
| Northport | Woolsey Memorial | A-I |
| Ontonagon | Ontonagon County | B-I |
| Paradise | new | |
| South Haven | South Haven Area Regional | B-II |
| Sault Ste. Marie | Sault Ste. Marie Muni-Sanderson | C-II |

Goal Achievement Summary: The system of airports identified in Table 23 results in the following level of performance achievement.

| Table 23 Goal Achievement Summary: Tourism/Convention Centers | |
|--|----|
| Number of Tier 1 B-II Airports | 39 |
| Tourism/Convention Centers Served (percent) | 96 |
| Number of Tier 2 Airports | 10 |
| Tourism/Convention Centers Served (percent) | 99 |

The 39 airports designated for inclusion in Tier 1 meet the target performance objective of 95 percent. The ten airports included in Tier 2 results in 99 percent of tourism/convention centers being served. All of the tourism/convention not served in Tier 1 or Tier 2 are marginally outside of the 30 minute surface travel time. No tourism/convention center in the state is more than 35 minutes from an airport designated in either Tier 1 or Tier 2.

General Population Access

Goal: Preserve/develop the system of airports necessary to respond to essential/critical aviation needs of the general population.

Background: A basic level of air transportation service to all Michigan residents is important.

System Standards: General population access system standards relate to proximity of an airport to the general population, the minimum classification of airport needed to adequately respond to general population access, and the performance target percent for general population access to be served by those airports. Table 24 summarizes the system standards for general population access.

| Table 24 | |
|--|-------------|
| System Standards: General Population Access | |
| Surface Travel Time | 45 minutes |
| Minimum Airport Classification | B-II |
| Tier 1 Performance Target | 95 percent |
| Tier 2 Performance Target | 100 percent |

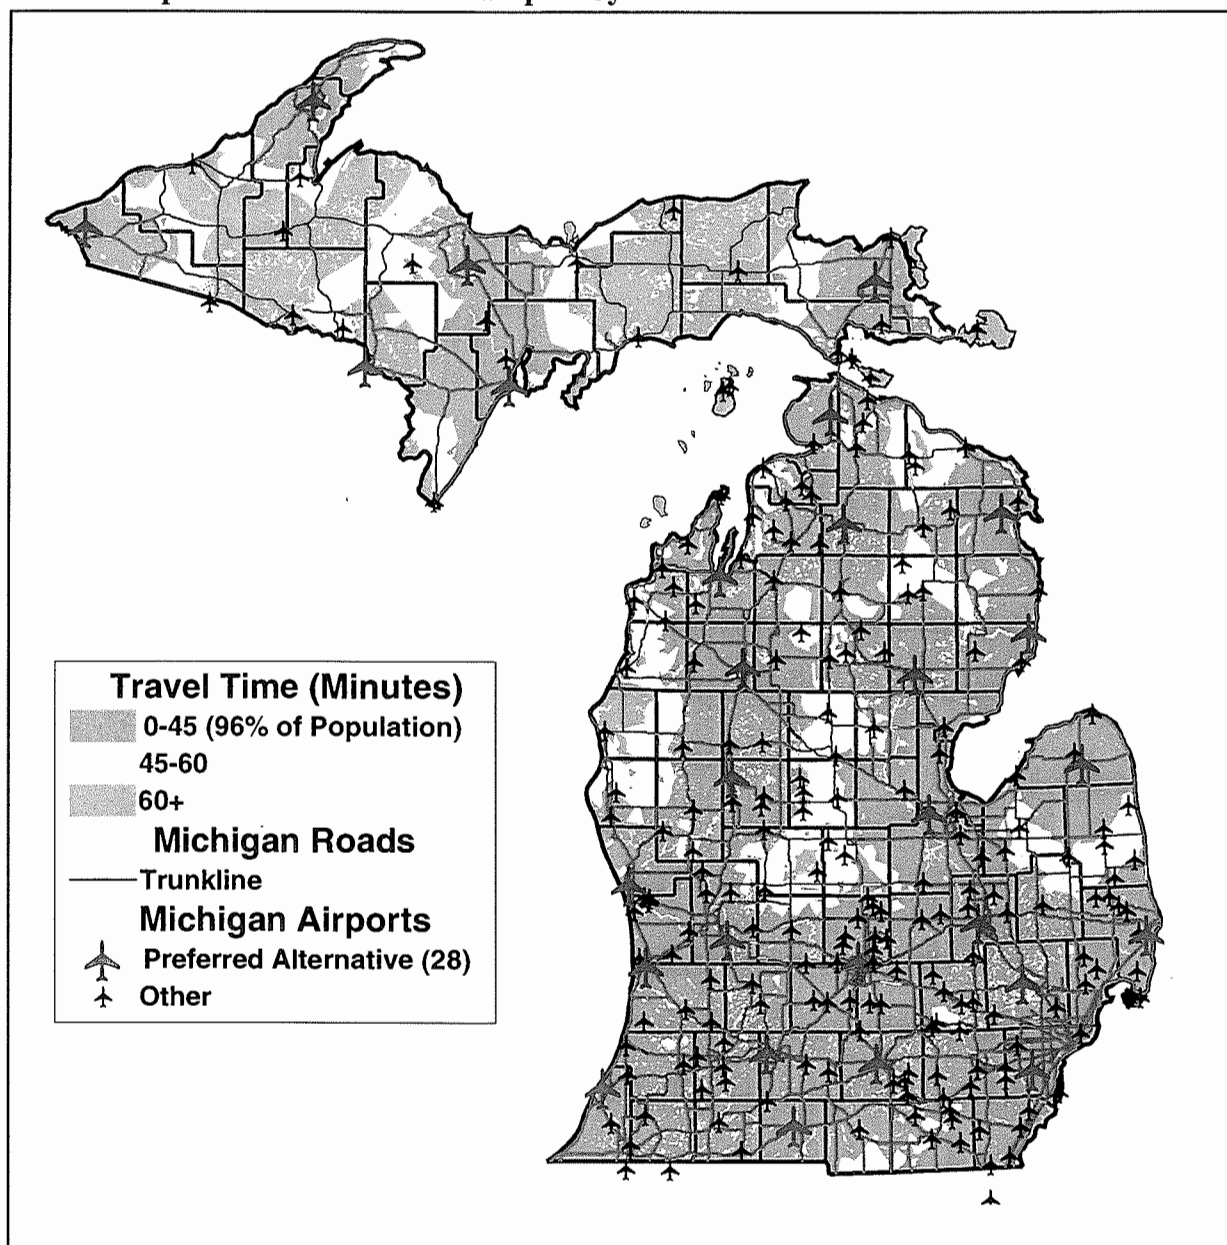

As described previously, the statewide travel demand model is the analytical tool used to determine the proximity of airports to the general population. That tool was used to determine the service area coverage of all candidate airports and the population served by those airports. In summary, general population access in Michigan is provided by 45 minutes surface travel time by airports in the B-II classification. Those airports needed to respond to 95 percent of the general population access are included in Tier 1; with the airports needed to respond to 100 percent of the general population access included in Tier 2.

System Recommendation: To the extent possible, airports that were already developed to the proper minimum airport classification were selected for inclusion in the general population access alternative. Additional airports to be included in Tier 1 were selected based on a combination of remoteness from a previously included airport, and the amount of additional population that would be served. None of the 28 airports included in Tier 1 for general population access would require a reclassification to the B-II category. The 28 airports included in Tier 1 for general population access are shown in Map 8

and identified in Table 25.

Map 8

General Population Access: Tier 1 Airport System

| Table 25 Tier 1 Airport System: General Population Access Minimum Airport Classification Standard: B-II | | |
|--|-----------------------------------|---------------|
| City | Airport | Current Class |
| Alpena | Alpena County Regional | D-III |
| Bad Axe | Huron County Memorial | B-II |
| Battle Creek | W. K. Kellogg | D-III |
| Benton Harbor | Southwest Michigan Regional | C-III |
| Big Rapids | Roben-Hood | B-II |
| Cadillac | Wexford County | C-II |
| Coldwater | Branch County Memorial | B-II |
| Detroit | Detroit Metro Wayne County | D-III |
| Escanaba | Delta County | D-III |
| Flint | Bishop International | D-III |
| Gaylord | Otsego County | C-III |
| Grand Rapids | Kent County International | D-III |
| Hancock | Houghton County Memorial | D-III |
| Holland | Tulip City | C-III |
| Iron Mountain | Ford | D-III |
| Ironwood | Gogebic-Iron County | D-III |
| Jackson | Jackson County-Reynolds | C-III |
| Lansing | Capital City | D-III |
| Marquette | Sawyer | D-III |
| Muskegon | Muskegon County | D-III |
| Oscoda | Osdoda-Wurtsmith | D-III |
| Pellston | Pellston Regional of Emmet County | D-III |
| Pontiac | Oakland County International | D-III |
| Port Huron | St. Clair County International | C-III |
| Saginaw | M B S International | D-III |
| Sault Ste. Marie | Chippewa County International | D-III |
| Traverse City | Cherry Capital | D-III |
| West Branch | West Branch Community | C-II |

Those airports required to achieve a 100 percent general population coverage are designated in Tier 2 and include the four airports identified in Table 26. All of these airports currently meet the B-II Airport Classification for service to the general population.

| Table 26 Tier 2 Airport System: General Population Access Minimum Airport Classification Standard: B-II | | |
|--|-------------------------|---------------|
| City | Airport | Current Class |
| Manistee | Manistee County-Blacker | C-II |
| Manistique | Schoolcraft County | C-II |
| Marlette | Marlette Township | B-II |
| Mt. Pleasant | Mt. Pleasant Municipal | C-II |

Goal Achievement Summary: The system of airports identified in Table 27 results in the following level of performance achievement.

| Table 27 Goal Achievement Summary: General Population Access | |
|---|----|
| Number of Tier 1 B-II Airports | 28 |
| General Population Served (percent) | 96 |
| Number of Tier 2 Airports | 4 |
| General Population Served (percent) | 99 |

The 28 airports designated for inclusion in Tier 1 meet the target performance objective of 95 percent. The four airports included in Tier 2 results in 99 percent of the state's population being served. By extending the service area coverage to 60 minutes rather than 45 minutes virtually all Michigan residents would be have access to an airport included in either Tier 1 or Tier 2.

Land Area Coverage

Goal: Preserve and develop the system of airports necessary to respond to provide basic land area coverage.

Background: General aviation pilots operating their aircraft in Michigan should have access to an airport with a paved runway within 30 miles in the event of a pilot or passenger emergency; or an aircraft malfunction. These airports provide a network of facilities that are reachable in many emergency situations. Airports located in adjacent states near Michigan borders were included in determining land area coverage percentages.

System Standards: Unlike many of the previous system standards where surface travel time is a key variable, with land area coverage the system standard relates uses a 30 mile radius as a key variable. As with the other system goals the target for goal achievement is 95 percent of land area coverage in Tier 1 and 100 percent in Tier 2..

| Table 28 | |
|---|-------------|
| System Standards: Land Area Coverage | |
| Surface Travel Distance | 30 miles |
| Minimum Airport Classification | B-I |
| Tier 1 Performance Target | 95 percent |
| Tier 2 Performance Target | 100 percent |

System Recommendation: To the extent possible, airports that were already developed to the proper minimum airport classification were selected for inclusion in the land area coverage alternative. Additional airports to be included in Tier 1 were selected based on a combination of remoteness from a previously included airport. Among the 50 airports included in Tier 1 for land area coverage are two airports that would require a reclassification to the B-I category. These airports are...

- ☐ Baraga, new
- ☐ Munising, Hanley Field

The other 48 airports currently meet the B-I airport classification standard. All 50 Tier 1 airports are shown in Map 9 and identified in Table 29.

Map 9

Land Area Coverage: Tier 1 Airport System

| Manistique | Schoolcraft County | C-II |
| Marlette | Marlette Township | B-II |
| Marquette | Sawyer | D-III |
| Menominee | Menominee-Marinette Twin City | C-III |
| Mt. Pleasant | Mt. Pleasant Municipal | C-II |
| Munising | Hanley Field | A-I |
| Muskegon | Muskegon County | D-III |
| Newberry | Luce County | B-I |
| Ontonagon | Ontonagon County | B-I |
| Oscoda | Osdoda-Wurtsmith | D-III |
| Pellston | Pellston Regional of Emmet County | D-III |

| | | |
|------------------|---------------------------------|-------|
| Pontiac | Oakland County International | D-III |
| Port Huron | St. Clair County International | C-III |
| Rogers City | Presque Isle County/Rogers City | B-I |
| Saginaw | M B S International | D-III |
| Sault Ste. Marie | Chippewa County International | D-III |
| Stambaugh | Stambaugh | B-I |
| Traverse City | Cherry Capital | D-III |
| West Branch | West Branch Community | C-II |

Goal Achievement Summary: The system of airports identified in Table 29 results in the following level of performance achievement.

| Table 30 Goal Achievement Summary: Land Area Coverage | |
|--|----|
| Number of Tier 1 B-I Airports | 50 |
| Land Area Covered (percent) | 98 |
| Number of Tier 2 Airports | 0 |
| Land Area Covered (percent) | 98 |

The 50 airports designated for inclusion in Tier 1 meet the target performance objective of 95 percent. No additional airports are included in Tier 2 since the practical maximum coverage has been attained by those airports selected in Tier 1. By extending the service area coverage to 40 miles rather than 30 miles virtually all Michigan land areas would have an airport with a paved runway within the coverage area.

Preserve Regional Capacity

Goal: Preserve adequate airport capacity in each region of the state to assure continued effective air transportation.

Background: There are 236 public use airports currently in operation throughout Michigan. At any given time several of these facilities are under pressure from local officials and/or developers to be closed and converted to an alternate use. These pressures are most often exerted on small general aviation airports operating in or adjacent to their service communities. This is a particular concern to airports operating in Southeast Michigan where additional airport closures would threaten overall regional capacity.

From a regional capacity perspective, airports need to continue in public use when...

- ☐ The airport is the only public use facility serving the area and should be preserved because of the access it provides to the community and access it provides the community to outside services.
- ☐ The airport is in an area where regional aircraft capacity is stressed and the facility needs to be preserved to assure continued regional capacity.
- ☐ The airport functions as a reliever to a large airport by allowing lower performance aircraft to utilize the smaller airport rather than the larger airport where the number of operations by high performance aircraft would be inhibited by the smaller aircraft. At very busy airports, a mix of slow aircraft and faster, heavier aircraft severely affects airport operational capacity. Preservation of a smaller airport that would provide an alternative to a very busy airport would benefit both types of aircraft operations.

In Southeast Michigan regional demand currently threatens regional capacity. Recent airport closures and the prospect of additional airport closures continue to put undue stress on regional aviation capacity.

System Standards: Using results of the based aircraft forecast presented in a previous chapter the demand and capacity requirements for each MDOT region are presented in Table 31. By setting the

| Table 31 Regional Capacity Requirements | | | |
|--|----------------------------|-----------------------------------|-------------|
| Region | 2020 Based Aircraft | Capacity Requirement at... | |
| | | 125% | 150% |
| Bay | 1,023 | 1,279 | 1,535 |
| Grand | 879 | 1,099 | 1,319 |
| Metro | 2,290 | 2,863 | 3,435 |
| North | 752 | 940 | 1,128 |
| Southwest | 815 | 1,019 | 1,223 |
| Superior | 317 | 396 | 476 |
| University | 1,320 | 1,650 | 1,980 |

Tier 1 threshold at 125 percent of forecasted demand and the Tier 2 capacity threshold at 150 percent of demand it was felt that the system would be able to adequately respond to future needs.

| Table 32 System Standards: Preserve Regional Capacity | |
|---|-------------|
| Within Each Region Aircraft Storage Capacity Should Exceed Demand | |
| Minimum Airport Classification | B-I |
| Tier 1 Performance Target (Capacity/Demand) | 125 percent |
| Tier 2 Performance Target (Capacity/Demand) | 150 percent |

System Recommendation: To the extent possible, airports that were already developed to the proper minimum airport classification were selected for inclusion in the regional capacity alternative. The Metro region is limited in its ability to respond to future capacity needs. Consequently, a number of airports located in counties adjacent to the Metro region were selected for inclusion in this alternative.

All of the 65 airports included in Tier 1 for regional capacity are currently at the B-I classification or higher. These airports are identified in Map 10 and listed in Table 33.

Goal Achievement Summary: The system of airports identified in Table 35 results in the following level of performance achievement.

| Table 35 Goal Achievement Summary: Regional Capacity | |
|---|-----|
| Number of Tier 1 B-I Airports | 65 |
| MDOT Regions Served (percent) | 100 |
| Number of Tier 2 Airports | 16 |
| MDOT Regions Served (percent) | 100 |

The 65 airports designated for inclusion in Tier 1 result in each of the seven MDOT regions meeting the target of 125 percent of based aircraft demand. The 16 additional airports included in Tier 2 results in each of the regions meeting the target of 150 percent of based aircraft demand.

Serve Isolated Areas

Goal: Support airports capable of providing essential transportation services during those times of the year when other transportation modes are unavailable to seasonally isolated areas.

Background: In 1996 the State Transportation Commission and the Michigan Aeronautics Commission adopted an *Island Transportation Policy*. This policy indicated that year round air access between the mainland and each of the populated Great Lakes Islands that were seasonally isolated due to weather conditions was important. Seven islands meet this criteria – Beaver, Bois Blanc, Drummond, Harsens, Mackinac, Neebish, and Sugar islands.

System Standards: A year round airport with a paved primary runway is the preferred facility to provide the necessary all weather link to the mainland. Recognizing that not all islands are capable of developing an appropriate airport facility, in some instances a helipad can be developed to provide the necessary mainland link.

| Table 36 System Standards: Isolated Areas | |
|--|-----------------|
| Surface Travel Time | on the island |
| Minimum Airport Classification | B-I or Heliport |
| Tier 1 Performance Target | 100 percent |

Recommended System: Three of the seven islands currently have an appropriate airport facility – Beaver, Drummond, and Mackinac islands. Two additional islands, Bois Blanc and Harsens, have airports with turf runways that could be reclassified to B-I. The remaining two islands, Neebish and Sugar, do not have a public use airport and given severe physical constraints would be candidates for development of heliports.

| Table 37 Tier 1 Airport System: Isolated Areas Minimum Airport Classification Standard: B-I or Heliport | | |
|--|-------------------|---------------|
| Island | Airport | Current Class |
| Beaver | Beaver Island | B-II |
| Drummond | Drummond Island | B-II |
| Harsens | Harsens Island | A-I |
| Mackinac | Mackinac Island | B-II |
| Neebish | new | Heliport |
| Bois Blanc | Bois Blanc Island | A-I |
| Sugar | new | Heliport |

Goal Achievement Summary: The system of airports identified in Table 38 results in the following level of performance achievement.

| Table 38 Goal Achievement Summary: Isolated Areas | |
|---|-----|
| Number of Tier 1 B-I Airports or Helipads | 7 |
| Islands Served (percent) | 100 |

The five airports and two helipads designated for inclusion in Tier 1 result in each of the seven seasonally isolated populated islands being served.

Goal Achievement Summary

Table 39 provides a summary of how the recommended system responds to each of the seven MASP system goals. In each case the recommended system meets or exceeds the target goal for Tier 1 airports. The Tier 1 target for each of the first five system goals is 95 percent. For Regional Capacity and Isolated Areas the target is 100 percent.

Although the Tier 2 target of 100 percent is reached for just two of the system goals, the system identified represents a reasonable and practical optimal system in Michigan. Generally, in those instances where the Tier 2 goal is not met, those areas not served are marginally outside of the service area. In some cases it is far more prudent to accept a deficiency than attempt to improve an airport with severe site limitations, or build a new airport in a physically constrained location.

| Table 39 Goal Achievement Summary | | | | |
|--------------------------------------|----------|----------------|----------|----------------|
| Goal | Tier 1 | | Tier 2 | |
| | Airports | Percent Served | Airports | Percent Served |
| Population Centers | 32 | 95 | 10 | 99+ |
| Business Centers | 35 | 95 | 15 | 97 |
| Tourism/Convention Centers | 39 | 96 | 10 | 99 |
| General Population Access | 28 | 96 | 4 | 99 |
| Land Area Coverage | 50 | 98 | 0 | 98 |
| Regional Capacity | 65 | 100 | 16 | 100 |
| Isolated Areas | 7 | 100 | 0 | 100 |

System Recommendation Summary

All of the airports designated in Tier 1 for each goal should be developed to their full and appropriate classification. In many cases this means development efforts will focus completing requirements for an airport's current classification. In a limited number of cases system recommendations indicate that an airport should be

reclassified to a higher class. Airport development efforts will focus on meeting the requirements for that higher classification. The 16 Tier I airports recommended for reclassification to a higher class are identified in Table 40. Reclassifications to the C-II category are indicated for seven of these airports based on population center and/or business center goals. Reclassifications to the B-II category are recommended for five of these airports based on tourism center and/or general population access goals. The remaining four reclassifications are based on the serve isolated islands goal and are call for either a reclassification to the B-I category or development of a new helipad.

| Table 40 System Reclassification Summary | | | |
|---|---------------------------------|---------------|--------------|
| City | Airport | Current Class | Future Class |
| Adrian | Lenawee County | B-II | C-II |

Tier 3 Airports

The remaining public use airports are all designated for inclusion in Tier 3. Almost all of these airports are either privately owned and/or have turf primary runways.

Airport Development Standards

AIRPORT DEVELOPMENT STANDARDS

Airport development standards are needed to compare existing airport facilities to a standard development template. This enables the *MASP 2000* to identify airport development items necessary to respond to system deficiencies. In the System Description chapter, six *MASP 2000* Approach Category/Design Group combinations were identified. Each of these has its own development standard.

Tier 1 Airport Development Standards

In the Goals and Objectives chapter facility goals for each airport component were identified. These facility goals relate to the primary runway system, pavement condition, all-weather access, year-round access, basic pilot and aircraft services, zoning, and navigational aids. Each airport classification has a set of development standards for each of these facility elements. These development standards are identified in Table 44 for Tier 1 airports.

Tier 2 Airport Development Standards

Airport development standards are identical to Tier 1 standards except for the requirements for a current airport zoning plan and an active zoning board.

Tier 3 Airport Development Standards

Airport development standards are identical to Tier 2 standards except for the requirements for weather reporting, a weather briefing system, communications, snow removal, open through the spring, hangars, pilot shelter, and staffing.

| Table 43 Airport Development Standards | | | | | | | |
|---|------------------------------|------------------------|-----------|-----------|-------------------------|-----------|-----------|

Airport Development Standards Notes

Pavement Condition Indices. The Michigan Department of Transportation since 1987 has been conducting field inspections of pavements at airports throughout Michigan on a routine basis and reporting conditions of pavements using a Pavement Condition Index (PCI) methods initially developed by the US Air Force. The PCI values for pavements range from a high of 100 for new pavements without any defects to a low of 0 for completely failed pavements. Different threshold values for "good" and "poor" apply for different classifications of airports and for different components of an airport – runway, taxiway, and apron.

Appropriate Surface Access. Airports in the state airport system should have appropriate highway and public transportation access responsive to both the volume and type of vehicular traffic requiring airport access. Airport surface access should be provided by a functional class of roadway suited to vehicle types/densities operating at a given class of airport. At some classes of airport, public or private means of transit should also be an alternative. The following describes the different types of roads...

- ☐ Arterial roads carry long distance, through-travel movements. They also provide access to important traffic generators. Arterial roads include interstate and other freeways; state routes between large and small cities; and important surface streets in large and small cities.
- ☐ Collector roads provide more access to property than do arterial roads. Collectors also funnel traffic from residential or rural areas to arterial roads. These roads include county, farm-to-market roads; and various connecting streets in large and small cities.
- ☐ Local roads primarily provide access to property. These roads typically include residential streets; and lightly-traveled county roads.

Description of Existing Michigan Airport System Facilities

A description and assessment of the existing Michigan airport system provides a variety of inputs into development of the Michigan Airport System Plan. The primary purposes of this assessment are...

Establishment of baseline operational data useful in developing forecasts of based aircraft and operations.

Establishment of baseline airport facility data that will be useful in identifying current airport and system deficiencies.

Establishment of an evaluation mechanism for measuring how effectively MASP airports are responding to identified goals and objectives.

The key product of this assessment of the Michigan airport system is:

A current and dynamic inventory of airport features as they relate to MASP airport classification and airport development standards.

Data Bases

There are currently two active data bases within MDOT where aviation related data is maintained. The *Transportation Management System* (TMS) is the official department repository for a vast array of data on all modes including aviation. The TMS has historically been the data source for Michigan Airport System Planning efforts. Analysis tools for the *MASP 2000* utilize the TMS. The *Airport Information Management System* (AIMS) maintains aviation data and is an effective tool in communicating with the FAA and aviation agencies in other states. There is a continuing need to maintain both the TMS and AIMS in the future. Therefore, in support of the *MASP 2000* effort, a link between these two systems has been developed. This results in one official data set and eliminates the existence of two "official" independent versions the same data. Data items currently residing in both systems will now be maintained, by agreement, in either the TMS or AIMS with the linkage between systems permitting an ongoing update of the data in each system.

Airport Facility Data Elements

The following summarizes the data elements included in the system plan in support of airport facility objectives. Each of these items relates to a specific facility goal and/or performance measure. As such, they need to be included in the *MASP 2000* inventory and will be monitored on a continuing basis to permit an ongoing assessment of the system as it relates to goals and performance measures.

Complete and Adequate Primary Runway System - Includes primary runway length, width, surface type, lighting system, taxi system, safety areas, and runway visual approach aid including a Precision Approach Path Indicator (PAPI), Visual Approach Slope Indicator (VASI) or equivalent. This data is gathered by airport inspectors, maintained by AERO in the AIMS, and transferred to the TMS periodically.

Pavement Condition Indices - Includes the current condition of the primary runway, access/parallel taxiway, and terminal apron. This data is gathered through field inspections, processed by BTP, and current year PCI values entered into the TMS.

All Weather Access System - Includes federal and/or state weather reporting systems such as Automated Weather Observation Systems (AWOS) located at select airports throughout Michigan, weather briefing systems, and ground assist radio communications such as a Ground Communication Outlet (GCO). This data is maintained by AERO in the AIMS, and transferred to the TMS periodically.

Year Round Access - Includes an indicator of whether the airport has snow removal, and a primary runway surface unaffected by spring thaw conditions. This data is maintained by AERO in the AIMS, and transferred to the TMS periodically.

Basic Pilot and Aircraft Services - Includes basic pilot services such as airport staffing, telephones, restrooms and pilot/passenger shelters that should be available at select categories of airports. This category also includes basic aircraft services such as fuel, aircraft maintenance, aircraft repair services, and hangar/aircraft storage services that should be available at select categories of airports. This data is maintained by AERO in the AIMS, and transferred to the TMS periodically.

Airport Zoning - Includes the presence of a current airport zoning plan, and an active airport zoning board at select categories of airports. This data is maintained by AERO in the AIMS, and transferred to the TMS periodically.

Instrument Approaches - Includes an indicator of whether the primary runway is served by a visual approach, non-precision approach, or precision approach. This data is maintained by AERO in the AIMS, and transferred to the TMS periodically.

Miscellaneous Navigational Aids - Includes an indicator of whether the primary runway or airport has Runway End Identifier Lights (REILS), a rotating beacon, segmented circle, a lighted wind indicator, and type of instrument approach including a precision approach (or GPS-3), non-precision approach (GPS-2), or none. This data is maintained by AERO in the AIMS, and transferred to the TMS periodically.

Facility Goals

FACILITY GOALS

The Michigan Airport System Plan not only identifies the location and appropriate airport classification of those airport facilities that need to be included in the *MASP 2000*, but also the development items that are basic to a properly developed system. The following section describes those facility elements that are crucial to a properly developed airport system. Included in each section is a discussion of the facility item, a figure displaying for each system goal, the number of airports meeting all the facility standards and those with deficiencies, and a table listing the number of airports meeting each component of a particular facility goal.

The *MASP 2000* does not attempt to identify which facility goals are more important relative to other facility goals. Nor does it attempt establish a the relative importance among system goals. Rather, establishing a hierarchy between system goals and facility goals will occur in an airport investment strategy which will be developed subsequent to completion of the *MASP 2000*.

Complete and Adequate Primary Runway System

Airports designated as Tier 1 in the state airport system should have a complete and adequate primary runway system including: a paved runway of appropriate length and width; an appropriate runway lighting system; access from the terminal/ramp area to the primary runway; a parallel taxiway when appropriate based on airport classification and/or activity level; and clear approaches with the appropriate glide slope.

Figure 9

**1999 Facility Goal Achievement:
Complete and Adequate Primary Runway System**

Table 44

**1999 Facility Goal Achievement: Complete and Adequate Primary Runway System
Number of Tier 1 Airports Meeting the Facility Standard**

| Item | System Goal | | | | | | |
|------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Runway Length | 29 | 28 | 30 | 28 | 47 | 57 | 3 |
| Runway Width | 29 | 27 | 35 | 28 | 47 | 55 | 2 |
| Runway Surface | 32 | 35 | 37 | 28 | 48 | 65 | 3 |
| Runway Lights | 32 | 35 | 37 | 28 | 47 | 58 | 4 |
| Runway Approach | 31 | 34 | 34 | 27 | 42 | 54 | 2 |
| Parallel Taxiway | 32 | 28 | 37 | 28 | 49 | 59 | 5 |

The largest number of deficiencies occur at business center, tourism/convention center, and regional capacity airports with

runway length and runway width not meeting the facility standard for that airport classification.

Pavements in "Good" Condition

Airports designated as Tier 1 in the state airport system should have pavements in their *primary runway system* in "good" condition.

Figure 10

1999 Facility Goal Achievement: Pavement Condition

Table 45
1999 Facility Goal Achievement: Pavement Condition
Number of Tier 1 Airports Meeting the Facility Standard

| Pavement Component | System Goal | | | | | | |
|------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Primary Runway | 24 | 26 | 25 | 18 | 33 | 45 | 2 |
| Primary Taxiway System | 25 | 25 | 25 | 20 | 35 | 45 | 2 |
| Terminal Apron | 25 | 27 | 28 | 21 | 36 | 47 | 2 |

Pavement condition at Tier 1 airports for each system goal is a concern. Primary runways meet the facility standard less than 75 percent of the time. Preservation of airport pavement infrastructure has been a point of emphasis in recent years and will continue to be emphasized in years to come.

All Weather Access

Airports designated as Tier 1 or Tier 2 in the state airport system should have all weather access. This includes an All Weather Observation System (AWOS) or equivalent, a Pilot Information Center (PIC), and a Ground Communication Outlet (GCO) or equivalent.

Figure 11
1999 Facility Goal Achievement: All Weather Access

Table 46
1999 Facility Goal Achievement: All Weather Access
Number of Tier 1 Airports Meeting the Facility Standard

| Component | System Goal | | | | | | |
|--------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| AWOS | 31 | 30 | 30 | 27 | 39 | 42 | 1 |
| Pilot Information Center | 18 | 17 | 20 | 19 | 25 | 31 | 1 |
| Ground Comm Outlet | 26 | 25 | 24 | 24 | 33 | 36 | 0 |

The All Weather Access program is a comparatively new program within AERO. As such, it is not surprising that particularly with the pilot information center and ground communication outlet additional work needs to be done. The Airport Investment Strategy will evaluate how vigorously these needs can be addressed and establish

a priority for responding to these needs.

Year-Round Access

Airports designated as Tier 1 in the state airport system should be open throughout the year. This means the airport should be able to clear the runway of snow in a timely fashion, and have at least one paved runway that would not be affected by spring thaw conditions.

Figure 12
1999 Facility Goal Achievement: Year Round Access

Table 47

1999 Facility Goal Achievement: Year Round Access
Number of Tier 1 Airports Meeting the Facility Standard

| Component | System Goal | | | | | | |
|------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Snow Removal | 32 | 35 | 37 | 28 | 47 | 65 | 4 |
| Open Through Spring | 32 | 35 | 37 | 28 | 48 | 65 | 3 |

There are only minor deficiencies in meeting the year round access facility standards. Almost all Tier 1 airports have a snow removal plan and are able to stay open through the spring thaw period.

Basic Pilot and Aircraft Services

Airports designated as Tier 1 in the state airport system should have an appropriate range of pilot/aircraft services.

Figure 13

1999 Facility Goal Achievement: Basic Pilot and Aircraft Services

| Table 48 1999 Facility Goal Achievement: Basic Pilot and Aircraft Services Number of Tier 1 Airports Meeting the Facility Standard | | | | | | | |
|---|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| Component | System Goal | | | | | | |
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Staffing | 32 | 34 | 33 | 28 | 44 | 64 | 2 |
| Fuel | 32 | 34 | 33 | 28 | 45 | 65 | 1 |
| Telephone | 32 | 35 | 37 | 28 | 47 | 64 | 3 |
| Restrooms | 32 | 35 | 37 | 28 | 47 | 64 | 3 |
| Pilot Shelter | 32 | 35 | 37 | 28 | 47 | 64 | 3 |
| Aircraft Maintenance | 30 | 32 | 28 | 25 | 49 | 65 | 5 |
| Aircraft Repair | 30 | 32 | 28 | 25 | 49 | 65 | 5 |
| Hangar | 31 | 35 | 33 | 27 | 44 | 64 | 1 |

Most Tier 1 airports meet virtually all of the facility goals for basic pilot and aircraft services. Only at Tourism/Convention Center airports and Land Area Coverage airports are problems indicated. Compared to other facility goals, these deficiencies are comparatively modest.

Airport Zoning

Airports designated as Tier 1 in the state airport system should have a current airport zoning plan and an active airport zoning board.

Figure 14

1999 Facility Goal Achievement: Airport Zoning

Table 49

1999 Facility Goal Achievement: Airport Zoning
Number of Tier 1 Airports Meeting the Facility Standard

| Component | System Goal | | | | | | |
|------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Active Zoning Board | 18 | 18 | 18 | 16 | 23 | 24 | 0 |
| Current Zoning Plan | 22 | 22 | 21 | 19 | 27 | 29 | 0 |

Although these airports have had an opportunity to develop and maintain airport zoning and have an active zoning board for many years, comparatively few airport sponsors have taken advantage of this opportunity. In recent years, this has become a point of emphasis of the Michigan Aeronautics Commission (MAC). The MAC has approved in a number of instances AERO staff participation on airport zoning boards and has taken a greater interest in seeing that

effective local airport zoning is in place. As with the All Weather facility goal, this is a comparatively new initiative and will take a number of years to be completely responsive.

Miscellaneous Navigational Aids

Airports designated as Tier 1 in the state airport system should have appropriate navigational aids including Runway End Identifier Lights (REILs), a rotating beacon, segmented circle and lighted wind indicator.

Figure 15
1999 Facility Goal Achievement: Navigational Aids

| Table 50 1999 Facility Goal Achievement: Navigational Aids Number of Tier 1 Airports Meeting the Facility Standard | | | | | | | |
|---|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| Component | System Goal | | | | | | |
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Runway End Indent Lights | 32 | 34 | 33 | 27 | 42 | 53 | 2 |
| Rotating Beacon | 32 | 35 | 38 | 28 | 47 | 62 | 4 |
| Segmented Circle | 23 | 25 | 28 | 20 | 39 | 52 | 4 |
| Lighted Wind Indicator | 32 | 33 | 33 | 28 | 44 | 56 | 2 |

For the most part, Tier 1 airports have most of the navigational aids appropriate for their classification. The greatest number of deficiencies are found at the Land Area Coverage airports and the Regional Capacity airports.

Appropriate Instrument Approaches

Airports designated as Tier 1 in the state airport system should have the appropriate two-dimensional or three-dimensional instrument approach system that permits reliable air operations in minimal weather conditions. In recent years and in the future, these approach systems are anticipated to utilize either two-dimensional or three-dimensional Global Positioning System (GPS) technology.

Figure 16

1999 Facility Goal Achievement: Instrument Approaches

Table 51

1999 Facility Goal Achievement: Instrument Approaches

Number of Tier 1 Airports Meeting the Facility Standard

| Component | System Goal | | | | | | |
|----------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Appropriate Instr Approach | 25 | 20 | 36 | 28 | 49 | 65 | 5 |

Three dimensional precision approaches at Population Center and Business Center airports meet standards less than 75 percent of the time. The two dimensional non-precision approaches indicated at the other Tier 1 system airports are generally in place.

Appropriate Surface Access

Airports designated as Tier 1 in the state airport system should have appropriate highway and public transportation access responsive to both the volume and type of vehicular traffic requiring airport access.

Figure 17
1999 Facility Goal Achievement: Surface Access

Table 52
1999 Facility Goal Achievement: Airport Surface Access
Number of Tier 1 Airports Meeting the Facility Standard

| Component | System Goal | | | | | | |
|------------------------|-------------------|-----------------|----------------|--------------------|-----------|-------------------|-----------|
| | Population Center | Business Center | Tourism Center | General Population | Land Area | Regional Capacity | Isolation |
| Number Tier 1 Airports | 32 | 35 | 39 | 28 | 50 | 65 | 7 |
| Road Access | 16 | 16 | 32 | 25 | 42 | 57 | 2 |
| Public Transportation | 21 | 25 | 38 | 28 | 49 | 65 | 5 |

The greatest deficiencies occur at population center and business center airports where both the highest level of highway access (arterials), and public transportation services are called for by airport

development standard.

Projected System Needs

PROJECTED SYSTEM NEEDS

The cost of keeping Michigan's airport system running safely and efficiently, and developed to meet capital needs through 2020 is estimated at \$2.3 billion. This figure includes anticipated capital improvements that have been historically funded through a combination of federal, state, and local sources. The cost of airport operations and maintenance are not included in this figure. The balance of this chapter will summarize capital needs for each airport tier and presents a breakdown by program category -- preserve, improve, expand.

Figure 18 displays the annual needs of the Michigan airport system by type of airport. Air carrier airports have approximately two thirds of the total system needs. General aviation airports in Tier 1 have about one fourth of the system needs. The remaining airports in Tier 2 and Tier 3 have about six percent of total system needs.

Figure 18
Annual Projected System Needs 2000-2020

Air Carrier Airports System Needs

Annual needs at the air carrier airports in Michigan will average \$78.1 million through 2020. Of this total, approximately \$24.6 million will be needed each year for preservation of airport Michigan Airport System Plan. pavements, lighting systems and other airport infrastructure. The balance, \$51.6 million will be needed each year for improvement projects including apron, taxiway, terminal, and other items essential to effective delivery of air carrier services.

General Aviation Airports System Needs

Annual needs at the *MASP 2000* general aviation airports average \$36.9 million through 2020. Those general aviation airports in Tier 1 represent 80 percent of those needs. Tier 2 and Tier 3 airports have 17 percent and 3 percent of those needs respectively. More than half the total general aviation airport needs, \$18.9 million annually, are for preservation of airport infrastructure including primarily airport pavements and lighting systems. Approximately \$7.7 million is needed annually for airport improvement projects. These improve projects include those projects necessary to respond to current deficiencies at these airports. The remaining \$10.3 million annual needs are for airport expansion projects. These expand projects are needed to respond to deficiencies at those airports that would be moving into a higher airport classification.

Figure 19
Annual General Aviation System Needs 2000-2020

Cost are presented in present day dollars and include construction and engineering dollars.

MASP Modification Process

MASP MODIFICATION PROCESS

One of the features of the *MASP 2000* is the ability to modify system recommendations to reflect changes in system goals, system standards, additions or deletions to the public use airport system, etc. A variety of analysis in the years ahead, some if quite logically unforeseen, may necessitate changes to the *MASP 2000*. The purpose of this chapter is to indicate how formal changes to the MASP 2000 will occur.

Goals and Objectives

Any changes to MASP 2000 goals and objectives including new goals, or refocusing of goal emphasis will be undergo an analysis by the MDOT Bureaus of Transportation Planning and Aeronautics. These changes will require Michigan Aeronautics Commission approval.

Likewise, any changes to system standards including airport classification, service standards or performance target will require Michigan Aeronautics Commission approval.

Tier 1/Tier 2 Airport Designation

Designation of an airport into either Tier 1 or Tier 2, or movement of an airport from one tier to another tier requires Michigan Aeronautics Commission approval. Staff recommendations to the Commission will be based on criteria established for each system goal. From time to time, as more current data becomes available, or techniques improve, staff analysis may indicate a shift in select airport tier placement may be appropriate.

Tier 3 Airport Designation

All public use airports are included in the MASP 2000. Those facilities not included in either Tier 1 or Tier 2 are designated as Tier 3 airports. In any given year a number of airports may be added to the system or dropped from the system based on their current licensing designation. No formal action is required from the Michigan Aeronautics Commission regarding these airports. However, the Commission will be periodically advised of additions and deletions to the Tier 3 airport system.

Facility Goals

Any modifications to MASP 2000 facility goals will require Michigan Aeronautics Commission approval. Staff will report to Commission periodically on the number of airports meeting facility standards.

Glossary

GLOSSARY

This section defines the terms used in the *MASP 2000* and provides a list of acronyms used in the report.

Glossary

Air Carrier Airport - An airport that has regularly scheduled passenger service licensed by BUAER or certificated by FAA

Aircraft Operation - A aircraft takeoff or landing.

Airport Infrastructure - Any and all physical facilities of a given airport.

Airport Zoning - A zoning ordinance established in accordance with the Airport Zoning Act.

Apron - The portion of the runway system that is adjacent to the terminal building, for boarding the aircraft. A paved area of the airport used for the loading, unloading or parking of aircraft.

Arterial Road - A major road that carries automotive traffic through regions and cities.

Based Aircraft - The number of aircraft housed at an airport as reported through airport inspections. Normally designation as a based aircraft means that an aircraft is housed at an airport for at least six months in a year.

Collector Road - A road that carries intra-city traffic or carries traffic from local roads to arterials.

Endangered Airport - An airport that is in a situation of imminent

closure.

Heliprot - A facility that allows for helicopter takeoff and landing.

Instrument Approaches - Instrument approach procedures established by the FAA for the purpose of accommodating aircraft arriving under instrument flight rules.

Itinerant Operation - An aircraft operation in which the aircraft departs from one airport and lands at a different airport.

General Aviation Airport - An airport established primarily for the accommodation of other than air carrier aircraft.

Local Operation - An aircraft operation in which the aircraft departs and returns to the same airport without an intermediate stop.

Local Road - A road that only carries traffic directly to and from a destination. There is very little through traffic on a local road.

Navigational Aid - A general term for all facilities that assist a pilot in operating an aircraft, such as runway lighting and other approach aids.

Parallel Taxiway - A taxiway that is placed beside and parallel to a runway allowing aircraft to taxi from one end of the runway to the other without being on the runway.

Primary Runway - The main runway in use at an airport. Generally, the longest and widest of the runways.

Segmented Circle - A navigational aid that indicates the runway alignment and any non standard traffic pattern in use at the airport. Normally contains a wind indicator.

Statewide Travel Demand Model - The Statewide travel Demand model is a tool to support the transportation planning process. It is a series of analytical techniques used to predict travel behavior and resulting demand on transportation facilities and services for a specific future time frame.

Common Acronyms
